1 Introduction

EagleFiler is an easy-to-use information manager. It lets you organize and search mail, Web pages, PDF files, notes, and [more](#). Use it to [collect](#) stuff from a variety of sources. Browse everything using a standard [three-pane interface](#). Organize using folders and annotate using [tags and notes](#), or just leave everything in one folder and [pin-point](#) what you need instantly using the live [search](#). Since EagleFiler stores its library in Finder format, you can use it in concert with the other tools in your Mac ecosystem.

EagleFiler in a nutshell:

1. With a single keypress, import a Web page, mail messages, a scrap of text, or any file on your Mac.
2. EagleFiler stores them in an open format: regular files and folders that are fully accessible to your other applications.
3. Optionally: encrypt the files, add tags, notes, color-coded labels, and other metadata.
4. Browse by folder or by tag, or use the live search to find the information you need (faster than Spotlight).
5. View, edit, or create documents directly in EagleFiler's streamlined interface, or double-click to edit using a more specialized application.

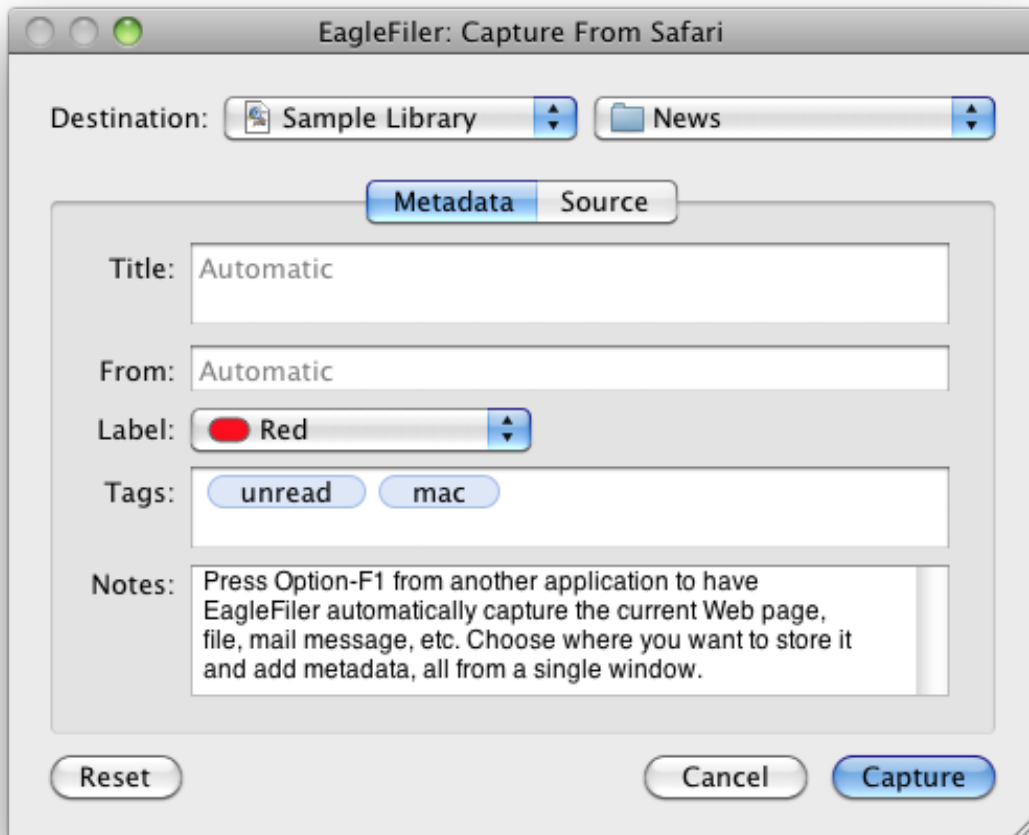

What can you do with EagleFiler? EagleFiler is a digital filing cabinet, a research assistant, and a snippet collector. You can use it to write a journal, track all the files for a project or job, save your favorite Web articles, store financial statements, run a paperless office, plan a trip, collect your course notes, archive your e-mail correspondence, search mailing list archives, research a purchase, remember recipes to cook or books to read, store scientific papers, gather legal case notes, or assemble a scrapbook. It's the most flexible tool on your Mac.

1.1 Importing Is a Snap

Getting your information into EagleFiler is easy. When you're viewing a Web page in Safari or [NetNewsWire](#)¹, looking at a mailbox in Mail, or browsing files in the Finder, just press the [capture key](#) (F1 by default, or Option-F1 to see the options below). EagleFiler will save the document into its library, and you can go right on working without interrupting your flow. (Of course, you can also use [drag and drop or other methods](#) if you prefer.) Once the document is in EagleFiler, you'll always have a copy of the way it looked when you imported it. No more bookmarking a great article, only to find out later that the page is no longer available or that registration or even payment is now required. If you do research on the Web, you know that pages change—sometimes

¹<http://ranchero.com/netnewswire/>

without notice—so it’s always good to keep a paper trail of exactly what you read. There’s no shame in being a digital pack rat when today’s Macs ship with tens or even hundreds of gigabytes of storage.

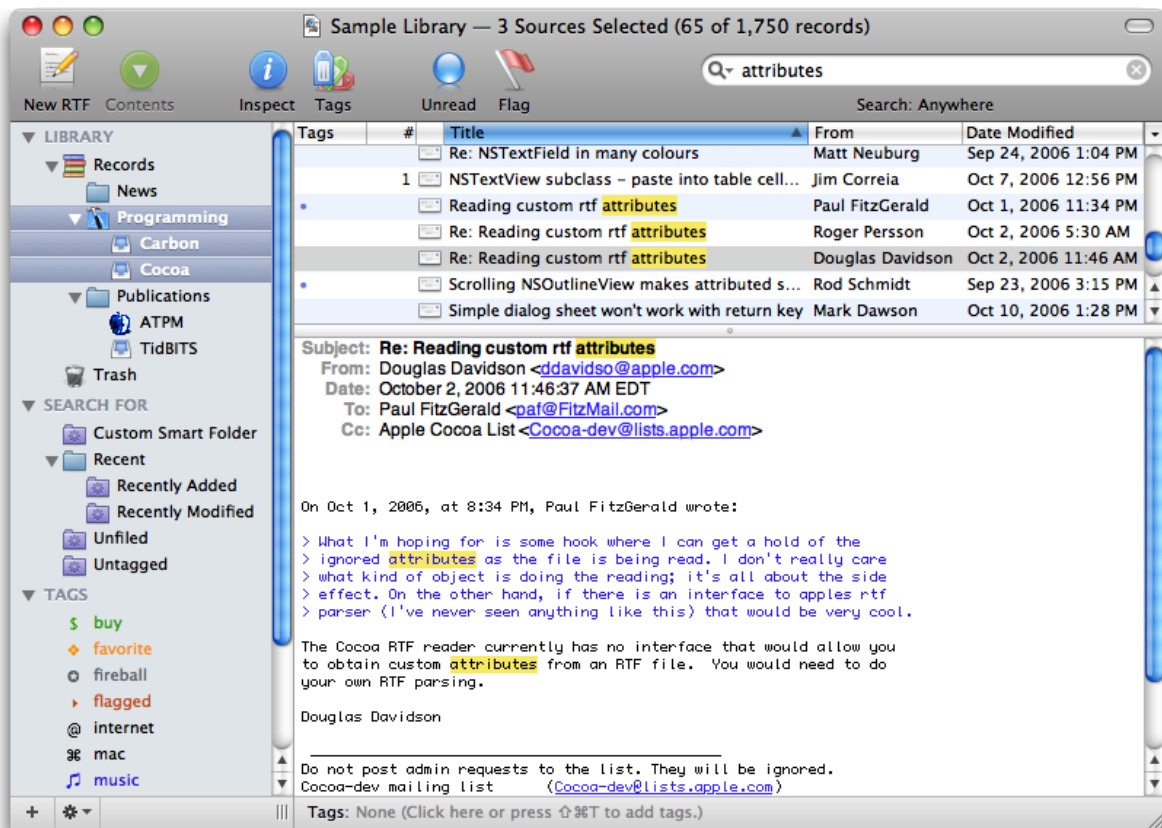

1.2 Familiar Mail-like Interface

EagleFiler browser windows use a three-pane view that’s familiar to any Mail user. This is not a database front-end; it’s a real Mac application with a fully Aqua user interface. Click on one or more sources to view their contents. Enter some text in the search box to filter the record list. Click on a record to view it right there in the window. HTML mail messages can be viewed as rich text, or you can view e-mails as plain text, complete with color-coded quoted text and clickable links. You can open as many windows as you want to view different parts of the library.

1.3 Search Everything

It's no good to store your information if you can't find it when you need it. Fortunately, EagleFiler offers some powerful search options. If you know the title, author, or recipient you're looking for, you can search by one of those fields. Or, use EagleFiler's indexed search to look through the entire contents of your documents. Like Spotlight, EagleFiler can search different types of files at once—after all, what matters is what you're looking for, not whether it's in a PDF, an e-mail, or a chat.

Unlike Spotlight, EagleFiler makes it easy to narrow down the results. You're searching within the library, not all the files on your hard disk, so the search is fast. You can select one or more folders or mailboxes within the library to restrict the search—reducing the amount of data that EagleFiler has to look through, and number of results that you'll have to comb through. You can even do [Boolean, tag, and phrase-based searches](#) to tell EagleFiler exactly what you're looking for. Once you've narrowed the search results to a manageable number of documents, it's easy to find the information you're looking for because you can view the document contents right there in EagleFiler.

For more complex searches, or for quick access to your most common searches, you can create your own [smart folders](#).

1.4 The Library Is Open

Like iTunes and iPhoto, EagleFiler keeps your data in a *library*. The library is just a [special folder](#) in the Finder that EagleFiler manages, so there's no lock-in. You shouldn't re-arrange the files and folders in the library except through EagleFiler, but other than that you can treat it just like a regular folder. Browse its contents in the Finder or [Path Finder](#)²—the folder structure matches the folders in EagleFiler.

View and edit the files using your favorite applications. Drag key files to the Dock or make aliases of them on your desktop. Search the files using Spotlight. Back them up using Time Machine. Label files in EagleFiler, and the labels automatically show up in the Finder—and vice-versa. Files in the library will still show up in your application's **Open Recent** menus, and Preview will still remember which page of the PDF you were reading. In short, you can capture, organize, and search your files using EagleFiler, without giving up the normal conveniences of the Mac experience.

1.5 Reliable Data Storage

The library may look like just a folder full of files, but EagleFiler uses a [Core Data](#)³ SQL database (with an automatic XML backup) to keep track of the files and their metadata. This lets you put thousands of files in the library and access them reliably and quickly. Each time you open a library, EagleFiler checks to make sure that all the files are present. It can even [verify](#) the library

²<http://www.cocoatech.com>

³<http://developer.apple.com/macosx/coredata.html>

(using [MD5 checksums](#)⁴) to make sure that none of the files has been corrupted. There's no point in storing and backing up damaged files. When you archive your documents in EagleFiler, you can be sure that when you need to read them again they'll be in pristine condition.

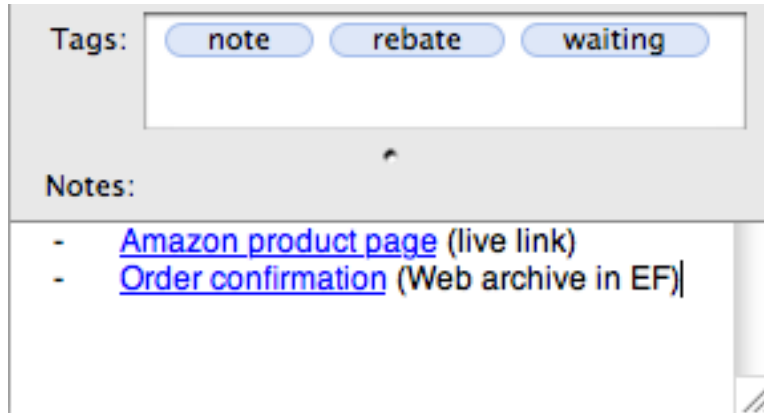

Plus, EagleFiler libraries go great with backups and archival. Your data is stored in individual files, so smart backup and synchronization programs won't waste time and space copying the documents that haven't changed. Since the files are in standard formats like PDF, RTF, and mbox, you'll be able to read them years from now, even if—alas—you're no longer using EagleFiler.

1.6 Add Tags and Notes

Tags are somewhat like labels in the Finder, except that each record can have as many tags as you want. EagleFiler has some tags such as “unread,” “flagged,” and “replied” built-in, and it will import these from Mail. If you've created additional tags in Mail using [MailTags](#)⁵, EagleFiler will import those as well. You can also create your own tags. Tags may be treated like keywords, and each tag also appears as a [source](#) in the [browser window](#), which acts like a playlist in iTunes or an album in iPhoto.

⁴<http://en.wikipedia.org/wiki/Md5#Applications>

⁵<http://www.indev.ca/MailTags.html>

Each document or message in EagleFiler can also have a note. Notes, which you can edit in EagleFiler’s **Info** inspector, are like comments in the Finder on steroids. They support rich text with multiple fonts, sizes, and colors. Notes can even include clickable links, graphics, tables, and lists. Use notes to write down information that goes with your documents, to excerpt key passages, to add your own comments or analysis, or to add links to related records in EagleFiler.

1.7 Speed Up and Simplify Your Other Applications

Most e-mail programs are designed for communicating with your mail server and letting you read and write messages—not for storing all your old mail. By cleaning out your mail program’s database, you can remove some clutter from its mailbox list and speed it up. EagleFiler preserves the entire message source, including headers and attachments, as well as [MailTags](#)⁶. But cleaning it out doesn’t have to mean lots of time wasted trying to predict which messages you might need in the future. Disk space is plentiful—just archive all your old mail into EagleFiler. Later, you’ll be able to find what you need with a quick search. Meanwhile, the archived messages will no longer be slowing down Spotlight searches of your files and current messages. Nor will they slow down and fill up your Time Machine backups.

Likewise, your Web browser’s bookmarks feature is great for remembering sites that you’ll want to go back to frequently. But it isn’t ideal for remembering the information found on Web pages. Don’t bookmark news articles, recipes, reviews, and other documents—and then try to look through your overflowing bookmarks folder to recall the articles by title and URL. Instead, capture the Web pages into EagleFiler where you’ll be able to search their entire contents.

1.8 Multiple Libraries

Some people like to dump all their information into a single EagleFiler library, with minimal folder structure, and locate documents that they need using the search feature. But EagleFiler also

⁶<http://www.indev.ca/MailTags.html>

supports multiple libraries, for those who like to separate their business and personal files, group them by project or client, or keep different kinds of files in different places. For example, you might keep some of your files on your iPod or USB keychain drive, some in an [encrypted library](#), and others in your Documents folder. Unlike with iPhoto and iTunes, you can have multiple EagleFiler libraries open at once. However you want to group your files, EagleFiler can accommodate.

1.9 Feature List

The following is a partial list of EagleFiler’s features, so that you can quickly see how it works and how it’s unique:

General

- Easy to install: just drag and drop a single application file. There’s no need to install a database engine, plug-ins, or script files to integrate with your other applications.
- Easy to use, with a familiar three-pane interface—lots of power, without lots of cluttered options.
- Makes efficient use of RAM and disk space.
- AppleScript support, for automation and integration with other applications.

Importing

- Can import any kind of file. EagleFiler has special support for displaying [most common formats](#), and it can use [Quick Look](#) to display the others.
- Just [press a hotkey](#) while in another application, and EagleFiler will intelligently import the Web page, mailbox, or file that you’re currently viewing.
- Press the [Quick entry](#) hotkey to create a new file in EagleFiler from any application.
- Store Web pages in the following formats: bookmark, PDF, PDF (single page), plain text, rich text, rich text with images, Web archive.
- Import from any application by printing and choosing **Save PDF to EagleFiler** or by saving a file into EagleFiler’s **To Import** folder or directly into the library’s folder structure.
- Move or save new files directly into the [library folder](#), and EagleFiler will auto-import them when it does a [Scan for New Files](#).
- Import Web pages using [bookmarklets](#)⁷.
- Automatically import scans by setting your scanner software (Fujitsu [ScanSnap](#)⁸ recommended) to save its files in the **To Import** folder.
- There are many other [ways to import](#) (e.g. drag and drop, services) so you can choose whatever’s easiest for the task at hand. Hold down the Option key when importing, and you can choose where to save the file and add tags, notes, and other metadata.

⁷<http://c-command.com/eaglefiler/bookmarklets>

⁸<http://www.fujitsu.com/us/services/computing/peripherals/scanners/scansnap/scansnap-s1500m.html>

- Automatically detects duplicate files to save disk space and help you see what’s already been imported.

Mail

- First-class support for archiving e-mail. EagleFiler understands the content of messages and treats them as mail rather than as text or RTF files.
- Import the selected [mailboxes or messages](#) simply by pressing a [hotkey](#).
- EagleFiler retains the full message data, including attachments, read/flagged/replied status, and [MailTags](#)⁹, so nothing is lost when moving mail into EagleFiler.
- Speed up your mail program by moving older messages to EagleFiler.
- Messages are efficiently stored using the standard “mbox” format and can be imported back into any mail program if desired.
- You can also store messages as individual `.eml` files, for Spotlight searchability, and you can freely convert between the `.eml` and mbox formats.
- Can display messages as plain text (with colored quote levels and clickable links) or as HTML.
- Extract your e-mail from a proprietary mail client database and convert it into standard mbox or `.eml` files.

Organization

- EagleFiler supports multiple libraries, stored wherever you want (hard disk, iDisk, iPhone, iPad, iPod, USB drive, etc.).
- You can open more than one library at a time, and more than one window per library.
- Files can be organized with folders and tags, both of which can be nested.
- Use the **Go** menu to quickly jump around to viewing different parts of your library.

Editing

- Create a new file with a single button or keypress and immediately begin typing. There’s no need to open a new window or go through a **Save** dialog box.
- Use [stationery](#) (a.k.a. templates) to quickly create any type of new file. Stationery can automatically trigger AppleScripts to dynamically fill in the metadata for you.
- RTF, text, OpenDocument, and bookmark files can be edited from within EagleFiler. Powerful text editing features include find & replace, spelling and grammar checking, smart links/quotes/dashes, data detectors, automatic text replacement, and case transformations.
- For other types of files (e.g. Word, Pages), just double-click to open them in your favorite editor. The changes are automatically saved back into the EagleFiler library.

Storage

⁹<http://www.indev.ca/MailTags.html>

- Your data and notes are stored in regular files using standard formats (RTF, PDF, Web archive, mbox, etc.), so there's no lock-in or risk of database corruption, and it plays well with [Time Machine](#)¹⁰.
- Uses MD5 checksums to [verify](#) the integrity of all files in the library, for safe long-term archival.
- Metadata (tags, titles, source URLs, etc.) goes into a [Core Data](#)¹¹ SQL database for reliable storage and quick access.
- EagleFiler automatically backs up the metadata and notes to XML property list files. In the rare event that the database file becomes damaged, you can import the files into a new library, and EagleFiler will build a new database and reconstruct all the metadata.
- Can copy tags into [OpenMeta](#)¹² and the Spotlight comments field to make them searchable and accessible to other applications.

Encryption

- Libraries can be encrypted with [AES-128 or AES-256](#)¹³ for secure, password-protected storage.
- Encrypted libraries are stored using Apple's disk image technology, so their contents are accessible on any Mac, whether or not EagleFiler is installed.
- The entire library contents—including the metadata, indexes, and temporary files—are encrypted. Unencrypted data never touches the disk.
- In other respects, an encrypted library works just like a regular one. It's still fully searchable, and the files are still accessible to other applications (once you've entered the passphrase).

Search

- EagleFiler uses its own optimized indexes so that you can search the contents of your library faster than with Spotlight.
- You can do exact searches across individual fields (title, filename, notes, tags, from, to/cc) as well as searches across the entire file contents.
- Searches can use phrases, wildcards, Boolean AND/OR/NOT, and grouping.
- Do quick tag searches by selecting one or more tags at once.
- Create your own smart folders and organize them into folders. Custom smart folders can contain an unlimited number of criteria, optionally using nested Any/All/None. You can define *actions* to occur when you drag a record onto a smart folder.
- Matching search terms are highlighted in the document contents and in the records list. Use the **Find** panel or its keyboard shortcuts to search within a document and to jump from one highlighted occurrence to the next.

¹⁰<http://www.apple.com/macosx/features/timemachine.html>

¹¹<http://developer.apple.com/macosx/coredata.html>

¹²<http://openmetainfo.org>

¹³http://en.wikipedia.org/wiki/Advanced_Encryption_Standard#Security_of_AES

- EagleFiler reads most files itself, so it can index text that Spotlight wouldn't see (e.g. files attached to e-mail messages, invisible Web content, [Skim](#)¹⁴ notes attached to PDF files). It automatically takes advantage of third-party Spotlight importer plug-ins to support custom file formats.
- Since the files and notes are stored out in the open, they're also searchable with Spotlight (for when you want to search your entire Mac at once), without the need for stub files in the `Caches/Metadata` folder.
- EagleFiler's search indexes are immediately available after syncing, restoring from a backup, or transferring your files to a new Mac; there's no need to wait for it to reindex, as with Spotlight.

Metadata

- For each file, EagleFiler records the document title, author/from, and source URL.
- You can assign tags (a.k.a. keywords). Tags can have abbreviation symbols and colors, and they can be nested. Quickly assign tags by typing (with auto-completion), drag-and-drop, or by clicking on them in the [Tag Cloud](#).
- The **Tags** column in the records list compactly shows the abbreviation symbols for all the assigned tags.
- Each file or mail message can have notes, which can include rich text, clickable links, images, and tables.
- Each file and folder can have a colored label, which also shows up in the Finder.
- You can copy links to EagleFiler records and paste them into notes or RTF files, or into other applications.
- When importing via the [capture key](#), EagleFiler can preserve metadata (e.g. tags, notes, titles, URLs) from the source application. This is often higher fidelity than using that application's own export feature.
- When importing an existing file, EagleFiler can import tags and notes from the file's Spotlight comments.
- EagleFiler can display and search [Skim](#)¹⁵ notes attached to PDF files.

2 Installing and Updating

2.1 Requirements

EagleFiler is a universal binary that runs natively on both PowerPC- and Intel-based Macs using Mac OS X 10.4 through 10.6.

¹⁴<http://skim-app.sourceforge.net>

¹⁵<http://skim-app.sourceforge.net>

2.2 Updating From a Previous Version

The easiest way to update EagleFiler is to use the [Software Update...](#) command to download and install the latest version.

Alternatively, you can replace the old EagleFiler application file with the new one. That is, if EagleFiler is installed in the **Applications** folder, drag the new EagleFiler application icon into the **Applications** folder and click **Replace** when the Finder asks if you want to overwrite the old version. If you get an error saying that you do not have sufficient privileges, drag the old EagleFiler to the trash and empty it, and then drag the new one into the **Applications** folder.

2.3 Installing EagleFiler

Drag the EagleFiler icon onto the **Applications** folder. Double-click the **Applications** folder to open it. Double-click the EagleFiler icon to launch it. Eject the white EagleFiler-1.5 icon.

It is recommended that you also install [Growl](#)¹⁶, to take full advantage of EagleFiler's notification features, although this is not required.

2.4 Uninstalling EagleFiler

To uninstall EagleFiler, drag its application file to the trash. Although you will no longer be able to open your libraries with EagleFiler, the files in the libraries will remain accessible in the Finder. Next to each library is a folder called **Files** (which contains the files and folders in the library) and a folder called **Notes** (which contains any notes that you've added).

3 Using EagleFiler

3.1 Basics

Welcome to EagleFiler. Like iTunes and iPhoto, EagleFiler stores its files in a *library*. To get started, choose [New Library...](#) from the **File** menu. You can save the library wherever you want, and you can create multiple libraries if desired. To add to your EagleFiler library, you can:

Import existing files or Web pages

The easiest way to import is often to press the [capture key](#) or the [capture with options key](#). EagleFiler will automatically figure out the current Web page or the selected mail messages and import them.

¹⁶<http://growl.info>

There are also many other [ways to import](#), such as drag and drop, the **Services** menu, and saving documents into the library's **To Import** folder or **Files** folder. Each file that you import is *copied* into the library, so you can delete the original if desired.

While EagleFiler is importing, it will show a green arrow in the Dock icon and a spinning progress indicator in the library's browser window. To ensure a correct import, do not modify or delete the files being imported until you can see that EagleFiler has finished.

Create new files using EagleFiler

The [New Record ▸ Rich Text File](#) and [New Record ▸ Plain Text File](#) commands in the **File** menu let you create new, empty files.

You can also add your own commands to the **New Record** submenu. This lets you create other types of files (e.g. Word or Pages documents) and create new files from templates. To do this, choose [New Record ▸ Open Stationery Folder](#) and copy your template files into this folder.

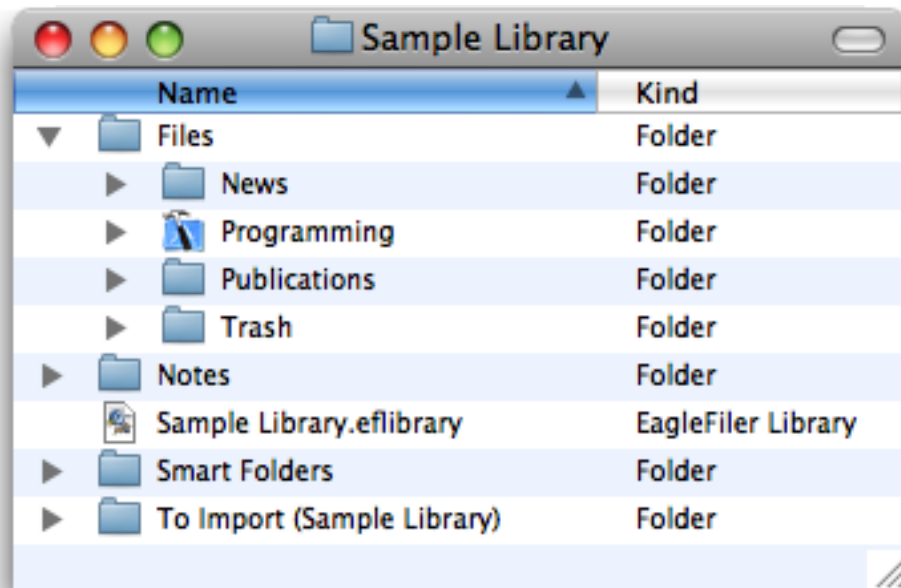

You can use [New Record ▸ From Clipboard](#) to create a new file with text copied from another application.

The contents of your libraries are stored in [library folders](#). The files are visible in the Finder, and you can view and edit them via other applications. However, the files are [managed](#) by EagleFiler, so you should only move, rename, or delete them from within EagleFiler.

Each library that's open in EagleFiler is displayed in one or more [browser windows](#). Each browser window contains a [source list](#), which lets you access the library's records. The *record* is the basic unit of information in EagleFiler. Files, folders, and mail messages are all records. Each record has contents that can be displayed (and perhaps edited) in the [record viewer](#). You can [search](#) for records and annotate them with tags and notes.

3.2 Library Folders

Outside of EagleFiler, for example when you are browsing in the Finder, each EagleFiler library appears as a *library folder* with the following structure:

- The `.eflibrary` file is the way that you open the library in EagleFiler. It also holds various information about the contents of the library, such as indexes that EagleFiler uses for searching, as well as tags and other metadata that you've added.
- The **Files** folder contains all the files and folders that have been imported into the library. The folder hierarchy within the **Files** folder matches that within EagleFiler, so you can easily browse and search the contents of your library from outside of EagleFiler.
- The **Notes** folder contains one RTF file for each record that has a note. You can edit a record's notes using the **Info** inspector. The notes are searchable within EagleFiler and also from Spotlight.
- One way to import files into the library is to move or save them into **To Import** folder. You can do this even if EagleFiler is not currently running. When EagleFiler completes the import, the files are in the **Files** folder and no longer appear in the **To Import** folder. You may wish to drag the **To Import** folder to your Dock or to the Finder's sidebar so that it's easy to find.
- If a file in the **To Import** folder cannot be imported, EagleFiler moves it to the **Unable to Import** folder. If there have not been any such errors, this folder will not exist.
- The **Smart Folders** folder contains a `.plist` file for each smart folder in the library. You can copy a smart folder from one library to another by copying the associated `.plist` file. (Make sure that the libraries aren't open in EagleFiler when you do this.)

The contents of the library folder are *managed* by EagleFiler. What this means is that the files and folders are fully accessible to other applications, but there are some limits to the kinds of changes you can make to the library from outside of EagleFiler.

You can:

- view and search the contents of the library folder using the Finder, Spotlight, and other applications.
- open files using other applications.
- edit files using other applications and save your changes (without changing the filename).
- add files to the **To Import** folder.
- add files and folders to the **Files** folder; EagleFiler will detect them when it does a [Scan for New Files](#).
- change the Finder label, Spotlight comments, and extended attributes of files in the library folder.
- edit folder and file icons using the Finder's **Get Info** window.
- store the library folder on a shared volume.

So long as you don't do it while the library is open in EagleFiler, you can:

- move or rename the library folder.
- rename the `.eflibrary` file.
- backup and restore the entire library folder.

You should not:

- open the library in more than one copy of EagleFiler at a time.
- move, rename, or delete files inside the **Files** or **Notes** folders.
- modify the `.eflibrary` file.
- move or rename the library folder's ancestor folders while the library is open in EagleFiler.
- edit the contents of mailbox files.
- store a library inside another library's folder.
- tag files from outside of EagleFiler.

These restrictions ensure that the contents of the library folder stay in sync with the `.eflibrary`, so that EagleFiler knows where all the files are.

A common question is about file synchronization software:

- It's fine to use software that copies folders quickly by only copying the files that have changed. An example of this is [SuperDuper's](#)¹⁷ Smart Update feature. Such software works great with EagleFiler because it copies data in only one direction at a time. You end up with the same result as if you'd done a regular copy, but it doesn't take as long. If you use ChronoSync, be sure to uncheck **Prune folders** and **Ignore invisibles**.
- You should not use software that synchronizes or merges by copying data in both directions at once. This is equivalent to adding/moving/renaming/deleting files, and so it would cause the **Files** and **Notes** folders to get out of sync with the `.eflibrary` file.

3.3 Ways to Import

In the **File** menu, the [New Record > Rich Text File](#), [New Record > Plain Text File](#), and [stationery](#) commands let you create new files from within EagleFiler. The [Quick entry](#) hotkey lets you create new files from within other applications.

However, in many cases you will want to import existing files (or parts of files) into EagleFiler. Usually, the easiest way to do this is to press the [capture key](#) or the [capture with options](#) key. EagleFiler will automatically determine what you have selected or what you're viewing in the current application, and it will import it into the library. For example, if you're looking at a Web page in Safari, you can press the capture key to import it as a Web archive. Press the capture with options key if you want to import it and, at the same time, assign tags or choose which folder it will go into.

Although the capture key is quick and easy, depending on the circumstances you may prefer to:

- Drag files, text, or a URL onto:
 - An EagleFiler browser window's [source list](#) or [records list](#). This can be useful if you want to import into a particular folder or tag source that you're currently viewing.
 - The [Drop Pad](#). The capture key is for importing whole documents. If you just want to import a selection of text, it's better to drag and drop onto the Drop Pad or EagleFiler's icon, or to use the service (see below).
 - The EagleFiler application icon (in the Finder or in the Dock).

Hold down the Option key if you want to see a dialog to set the destination folder, label, tags, notes, etc.

- Select some items or text in another application and choose **EagleFiler: Import** from the **Services** menu (inside application menu) or press Command-%. To see the options window, choose **EagleFiler: Import With Options** or press Command-Option-%.

You may have to log out and log in again after installing EagleFiler in order for EagleFiler's services to appear in the **Services** menu. From the **Keyboard** pane in System Preferences,

¹⁷<http://www.shirt-pocket.com/SuperDuper/SuperDuperDescription.html>

you can change the keyboard shortcuts and also make the services appear in other applications' contextual menus.

- While viewing a document in another application, choose **File** ▸ **Print** and then choose **Save PDF to EagleFiler** from the **PDF** button menu. This will convert the document to PDF format and import it into EagleFiler. As with the **To Import** folder (see below) this can be useful when you're viewing a Web page (such as an Amazon order confirmation page) that cannot be imported by URL. Hold down the Option key if you want to see a dialog to set the destination folder, label, tags, notes, etc.
- Save files or folders into the **To Import** folder that's next to the `.eflibrary` file in the Finder. When the library is opened (and, periodically, while it's open) EagleFiler checks this folder, imports any files that are in it, and then deletes them.
 - If you use a scanner, you can set its software to use the **To Import** folder as its output folder, thus automatically importing the scans into your library.
 - You can put **To Import** folder(s) in the sidebar in the Finder so that they're available in every application's **Save** panel.
 - Before saving a Web page into the **To Import** folder, you can clean it up using [Readability](#)¹⁸.
 - Do not copy folders into the **To Import** folder, as this may take a while and EagleFiler may start importing before the copy is complete.
- Add files directly to the library's **Files** folder that's next to the `.eflibrary` file in the Finder. This is more flexible than using the **To Import** folder (since you can save into a particular subfolder), although the new files will not be auto-imported until EagleFiler does a [Scan for New Files](#).
- Click on one of the EagleFiler [bookmarklets](#)¹⁹ in your Web browser.
- Choose [Import Files...](#) from the **File** menu.
- Choose [Import URLs...](#) from the **File** menu.
- Drag files from one EagleFiler library window to another. This will preserve all of the tags, notes, and other metadata.
- Put some text on the clipboard using **Edit** ▸ **Copy** and then choose **Import Clipboard** from EagleFiler's Dock menu or [New Record](#) ▸ [From Clipboard](#) from the **File** menu.
- Control-click on a file in the Finder and choose **Open With** ▸ **EagleFiler**.
- Install some AppleScript files so that you can import directly from [LaunchBar](#)²⁰ or [Quicksilver](#)²¹.

¹⁸<http://lab.arc90.com/experiments/readability/>

¹⁹<http://c-command.com/eaglefiler/bookmarklets>

²⁰<http://c-command.com/scripts/eaglefiler/launchbar-import-text>

²¹<http://c-command.com/scripts/eaglefiler/quicksilver-import-text>

- Run an AppleScript such as:

```
tell application "EagleFiler"
    import files {POSIX file "/Users/mjt/Desktop/MyFile"}
    import URLs {"http://www.apple.com", "http://c-command.com"}
end tell
```

In all cases, the data is *copied* into the EagleFiler library (as with iPhoto). EagleFiler automatically detects duplicate files so that only one copy of each document is stored in the library.

If more than one library is open (and you didn't drag into a specific browser window), EagleFiler assumes that you meant to import into the current library (the one with the frontmost window). If no library is open, EagleFiler will show a dialog asking you to open one; then you can click the **Import** button to import the files into that library.

For advice about how to import e-mail messages, see the [Importing Mail](#) section.

3.4 What Can Be Imported

EagleFiler can import virtually any file on your Mac, as well as Web pages that are displayed in your browser and e-mail messages that are displayed in your mail program. EagleFiler has specialized importing and viewing support for the following types of files:

- [Bean](#)²² documents.
- Bookmark (.webloc and .url) files and bookmarks dragged from [Safari](#)²³ and [OmniWeb](#)²⁴.
- Chat transcripts from [iChat](#)²⁵.
- Dragged text from other applications. In some cases, EagleFiler will be able to import more information if you drag the text onto one of its windows rather than its Dock icon. For example, when dragging text from Safari, EagleFiler will be able to store URL that goes with the text.
- Folders. EagleFiler imports the contents of the folder (and any subfolders, preserving the hierarchy).
- HTML files.
- iCalendar (.ics) files.
- Images.

²²<http://www.bean-osx.com>

²³<http://www.apple.com/macosx/features/safari/>

²⁴<http://www.omnigroup.com/applications/omniweb/>

²⁵<http://www.apple.com/macosx/features/ichat/>

- Keynote presentations.
- Mailboxes in mbox format, Apple Mail mailboxes (attachments included), and Apple Mail archive mailboxes. The [Importing Mail](#) section explains the recommended ways to import mail messages from each e-mail program.
- Mail messages, stored as `.eml` files.
- Microsoft Word files.
- Movies.
- Numbers spreadsheets.
- OpenDocument Text files.
- Pages documents.
- PDF files. EagleFiler also understands PDFD bundles created by [Skim](#)²⁶ and can display and index Skim notes that are attached to PDF or PDFD files.
- PostScript and EPS files.
- Property list files (XML and binary).
- Rich Text (RTF and RTFD) files.
- RSS mailbox folders from Apple Mail.
- Sounds and music.
- Text files (encoded with ASCII or UTF-8, or with a byte-order-mark) and text clippings.
- URLs, which will be downloaded and converted to Web archives.
- vCard (`.vcf`) files from Address Book.
- Web archives.

Documents that aren't of any of the above types can also be imported into EagleFiler. EagleFiler can preview their contents using [Quick Look](#), and it uses Spotlight's importers to index them for searching. You can use the [Open With External Viewer](#) command to open the documents in other applications.

When importing files, EagleFiler automatically [imports tags](#) from the Spotlight comments and extended attributes.

²⁶<http://skim-app.sourceforge.net>

3.5 Importing Mail

Importing mail into EagleFiler speeds up your mail program and backups, creates an efficient and secure archive of your mail, and lets you organize and search mail messages alongside related files. The recommended way to import mail varies depending on which mail program you're using:

Apple Mail

Select some messages (either from regular mailboxes or smart mailboxes) and press the [capture key](#). EagleFiler will preserve the message status and flagged indicators from Mail, as well as any keywords, projects, and notes from [MailTags](#)²⁷. EagleFiler is able to import messages from IMAP mailboxes, however it will only import the parts of the messages that have been downloaded from the server. Thus, it is recommended that you select the option in Mail's preferences to keep **All messages and their attachments** for offline viewing. Another way to import from Apple Mail is to drag and drop folders or mailboxes from the Finder. This makes it possible to import whole hierarchies of mail.

Note: EagleFiler can also import “archive mailboxes” that have been exported from Mail, but for better data fidelity it is recommended that you import the mailbox back into Mail and then capture the messages from Mail to EagleFiler.

Entourage

Select a mailbox or some messages and press the [capture key](#). EagleFiler will preserve the message flags, categories, and projects. EagleFiler skips messages that have been assigned the “OmitFromArchive” category in Entourage.

Eudora

Mailboxes for Eudora 6 are stored in the `Mail Folder` folder inside the `Eudora Folder` folder, and they can be dragged from the Finder into EagleFiler. They are not actually in mbox format (for example, the attachments are removed), but the format is close enough that EagleFiler will be able to read most of the messages. Running the mailboxes through [Eudora Mailbox Cleaner](#)²⁸ before importing them into EagleFiler may produce better results. The `.toc` files are not mailboxes and should not be imported.

GyazMail

Select some mailboxes and choose **File** ▸ **Export** ▸ **Unix mbox...** Then drag the exported files into EagleFiler.

Mailsmith

Select some mailboxes or messages and press the [capture key](#). EagleFiler will preserve the notes (as EagleFiler notes) and message status and label (as EagleFiler tags). You may find it helpful to use [Email Archiver](#)²⁹ to separate messages by age before importing them into EagleFiler.

²⁷<http://www.indev.ca/MailTags.html>

²⁸<http://homepage.mac.com/aamann/Eudora-Mailbox-Cleaner.html>

²⁹<http://www.garrison.com.au/freeware/emailarchiver.html>

Outlook

Select some messages or a folder and press the [capture key](#). EagleFiler will preserve the message flags, read status, and categories. EagleFiler skips messages that have been assigned the “OmitFromArchive” category in Outlook. To import from multiple folders at a time, use a smart folder to show messages from multiple mailboxes at once (for example, use “Date Created Any Date” to show all messages), select all the messages, and press the capture key.

To import .pst files from the Windows version of Outlook, import them into the Mac version of Outlook, then select the messages and press the capture key.

Outspring Mail

The messages are stored in the folder:

```
/Users/<username>/Library/Application Support/Outspring Mail/
```

as individual .eml files. They can be imported into EagleFiler via drag and drop or by pressing the [capture key](#) in the Finder.

Postbox

Before importing into EagleFiler, make sure that Postbox has completely downloaded all the messages and use the **Compact Folders** command. The POP/local mailboxes are stored in the folder:

```
~/Library/Application Support/Postbox/Profiles/<profile>/Mail/Local Folders/
```

The IMAP mailboxes are stored in the folder:

```
~/Library/Application Support/Postbox/Profiles/<profile>/ImapMail/
```

The mailbox files have no extension and can be dragged from the Finder to EagleFiler. The .msf files are not mailboxes and can be ignored or deleted from EagleFiler’s library.

PowerMail

Select some folders or messages and press the [capture key](#). EagleFiler will preserve the message status and label.

Thunderbird and Eudora 8

To import an individual message from Thunderbird, select the message and choose **File** > **Save As** > **File**. Save the .eml file into EagleFiler’s **To Import** folder.

To import whole mailboxes from Thunderbird, make sure that Thunderbird has completely downloaded all the messages and use the **Compact Folders** command. The POP/local mailboxes are stored in the folder:

```
/Users/<username>/Library/Thunderbird/Profiles/<profile>/Mail/Local Folders/
```

The IMAP mailboxes are stored in the folder:

/Users/<username>/Library/Thunderbird/Profiles/<profile>/ImapMail/

The mailbox files have no extension and can be dragged from the Finder to EagleFiler. The .msf files are not mailboxes and can be ignored or deleted from EagleFiler's library.

Webmail

Web-based mail services do not store mail files on disk, so there is nothing for EagleFiler to read. The best way to import Webmail is to connect to the mail account using one of the above mail programs. If your Webmail does not support this, you can drag and drop text from your Web browser, use **File** > **Save** to save messages into EagleFiler's **To Import** folder, or print and choose **Save PDF to EagleFiler**.

EagleFiler has native support for viewing e-mail messages. There are two options in the [The View Menu](#) for controlling how messages are displayed: [Message > Plain Text](#) and [Message > Raw Source](#). The plain text font and size can be set in the [Preferences](#). You can use the [Quick Look](#) command in the [The Record Menu](#) to preview attached images. The [Reply to Message](#) command lets you resume a conversation by opening a new message in your e-mail program. You can also double-click a message to open it in your e-mail program (e.g. to forward it or to access the attachments). EagleFiler opens messages using Mac OS X's default viewer for .eml files, which is normally Apple Mail. To change the default viewer, use the [Open With](#) command.

When importing mail:

1. EagleFiler imports the entire raw source of the message, including the attachments and headers. In other words, all the information is preserved; if desired, the messages can be imported back into the mail program with full fidelity. (Exceptions: When importing from Eudora, EagleFiler imports the message text as processed and stored by Eudora, and it does not import the attachments, which Eudora stores separately. Webmail messages imported as PDFs do not include the full source or attachments.)
2. As with other types of imports, EagleFiler copies the messages into its library. When it's done, you can delete the messages from your mail program. It's simpler to have each message stored in only one place (the mail program or EagleFiler), and this way you won't accidentally import multiple copies of the same messages into EagleFiler.
3. EagleFiler stores messages in mailbox ("mbox") files. This is both for efficiency (one file rather than thousands for a mailbox containing thousands of messages) and for compatibility with other software that can read the standard mbox format.
4. If you prefer to store your messages as individual .eml files rather than mailboxes, you can drag and drop the messages out of the mailboxes once they're in EagleFiler. You can also import an individual message directly from Apple Mail via drag and drop.
5. Each time you import from a mailbox, a new mailbox file is created in EagleFiler, using the same name as in your mail program. If you had previously imported from that mailbox, you may already have a mailbox file in EagleFiler with that name.

- Some people like to leave each import as a separate mailbox, e.g. so that for each mailbox there's one file per month or per year.
 - Others prefer to have a single file that holds all the messages imported from that mailbox over time. To do this, select the **Records** source and sort by title. This will group the related mailboxes together. You can then select the related mailboxes and use the [Merge Mailboxes](#) command to combine them into a single mailbox. The combined mailbox will be stored in the folder that contained the oldest of the selected mailboxes, so your organizational structure is preserved even though the newly imported mailbox might have been imported at the top level.
6. As described in the [Basics](#) section, you should not modify or delete the mail while EagleFiler is in the midst of importing it.

3.6 Drag and Drop

This section summarizes the different ways that you can use drag and drop in EagleFiler:

Source List

Folders

Drag a folder or mailbox onto a folder to rearrange the folders in the source list. Drag a file from the records list onto a folder to move it into that folder. Drag onto the **Records** source to move the record to the top-level **Files** folder; it will then appear under **Unfiled**.

Drag from another application onto a folder in order to import directly into that folder. EagleFiler supports spring-loaded folders. If you drag and hover over a collapsed folder, it will expand so that you can drag onto one of its subfolders.

Smart Folders

Drag a record onto a smart folder to apply the smart folder actions that you've set in the [Edit Smart Folder...](#) window.

Drag and drop smart folders into folders to rearrange the source list.

Tags

EagleFiler supports hierarchical tags. Drag and drop tags to rearrange them in the source list.

Drag records onto a tag to assign them that tag.

Drag from another application onto a tag in order to import the dragged items and then assign that tag.

Records List

With a folder selected in the source list, drag onto the records list to move the records into that folder (if dragging from another EagleFiler window) or to import into that folder (if dragging from another application).

Drag from the records list onto a folder or tag in the source list in order to move the records or assign that tag.

Drag to the [record viewer](#) or the notes pane of the **Info** window to create a link to the selected records.

Drag to the Finder to create aliases to the files in EagleFiler. Option-drag to copy the files out of the EagleFiler library.

Drag to a text view in another application to create links to the selected records.

Record Viewer

You can drag and drop text and images to/from other applications as normal.

When editing a rich text file, drag in an EagleFiler record to create a link to it.

Notes

You can drag and drop text and images to/from other applications as normal.

Drag in an EagleFiler record to create a link to it.

Drop Pad and Dock

Drag from another application onto EagleFiler's **Drop Pad** window or Dock icon to import into the current library.

When dragging from another application, you can drag files, URLs, or text to import them into EagleFiler.

3.7 Shortcuts

This section summarizes EagleFiler's built-in keyboard shortcuts. Many other keyboard shortcuts are available in the menus, and you can search the menu commands using the **Search** field in the **Help** menu. You can customize the keyboard shortcuts from the **Keyboard** pane in **System Preferences**.

Importing

F1

[Capture Key](#). (Depending on your settings in System Preferences, you may need to press fn-F1.)

Option-F1

[Capture with options](#). (Depending on your settings in System Preferences, you may need to press fn-Option-F1.)

Command-%

The "EagleFiler: Import" system service. Type this from another application to import the selected text or URL into EagleFiler.

Command-Option-%

The “EagleFiler: Import With Options” system service. Type this from another application to import the selected text or URL into EagleFiler. EagleFiler will show the options window so that you can set the destination folder, label, tags, notes, etc.

Batch Change

Shift-Command-A

Append.

Shift-Command-R

Replace.

Command-3

Choose label.

Enter

OK.

Capture with options

Command-1

Choose library.

Command-2

Choose folder. Then you can select a folder by typing the first few letters of its name.

Command-3

Choose label.

Command-K

Reset.

Enter

Capture.

Info inspector

Command-click title bar

Show a path menu for the file being inspected.

Tags inspector

Spacebar

Toggle whether the tag is assigned to the selected records.

Navigating browser windows

Command-Option-F

Make the search field active.

Command-Shift-T

Make the tag bar active.

Tab (in source list) or Control-Shift-Tab (in record viewer)

Make the records list active.

Tab (in records list) or Shift-Tab (in source list)

Make the record viewer active.

Control-Tab (in record viewer) or Shift-Tab (in records list)

Make the source list active.

Editing a rich text file or notes

Option-Tab

Begin a new bulleted list.

Tab

Increase the indentation of the current list item.

Shift-Tab

Decrease the indentation of the current list item.

Records list

Enter or Return

Edit the filename of the selected record.

Option-Enter or Option-Return

Edit the title of the selected record.

Delete

Delete the selected records (if viewing a folder) or untag them (if viewing a tag).

Option-Delete

Delete the selected records.

Command-Up Arrow

View the container of the current folder or mailbox (i.e. go up a level in the hierarchy).

Command-Down Arrow

View the contents of the selected folder or mailbox (i.e. go down a level in the hierarchy).

Down Arrow or Command-Control-Down Arrow

View the next record. Down Arrow works in the records list. Spacebar works in the records list and in uneditable viewers. Command-Control-Down arrow works everywhere, even from an inspector window.

Up Arrow or Command-Control-Up Arrow

View the previous record.

Double-click

Open a folder or mailbox in the same window, like [Contents of Record](#), or open a file in the external viewer.

Command-double-click

[Open With External Viewer](#).

Option-double-click

[Open Source URL.](#)

Drag to an EagleFiler browser window

Copy the record to another library.

Drag to a text window

Create a clickable link to the record.

Drag to Finder

Create an alias to the file.

Option-Drag to Finder

Create a copy of the file.

Shift

Hold the Shift key while mousing over a record to see the tooltip faster. The tooltip shows the path and source URL.

Spacebar

[Quick Look](#)

Option-Spacebar

[Slideshow](#)

Three-Finger Swipe Left

Select the previous record.

Three-Finger Swipe Right

Select the next record.

Source list**Left/Right Arrow**

Collapse or expand the selected sources.

Option-Left/Right Arrow (or Option-click disclosure triangle)

Collapse or expand the selected sources and all their children.

Command-Up Arrow

Select the enclosing folder in the source list.

Double-click or Return

[Open in New Window.](#)

Enter or Return

Edit the filename of the selected source.

Type-selection

Type the first few letters of a source's name to select it.

Hiding

Option-click on another application

Switch to that application and hide EagleFiler. While hidden, EagleFiler will temporarily show itself if you press the [Capture with options](#) key and then re-hide itself automatically.

Option-click on an EagleFiler window

Bring EagleFiler to the front and hide the other applications.

Double-click on the horizontal split bar

Hide or show the record viewer.

Tags Bar**Spacebar, Return, or Comma**

End the current tag so that you can begin typing the next one.

Tab

Move focus to the search field. Press Tab-Tab to move to the [source list](#) or Tab-Tab-Tab to move to the [records list](#).

Toolbar**Option-click New RTF**

Creates a new plain text file.

Option-click Tags

Opens the [Tag Cloud](#) window.

3.8 Applications That Support Capture

EagleFiler's capture feature lets you import the current window or items from the frontmost application, just by pressing a key. The [capture key](#) and [capture with options](#) key work in these applications:

[Address Book](#)

Captures a vCard file for the selected contacts.

[BBEdit](#)

Captures the file of the first document of the front window.

[Camino](#)

Captures the URL of the current tab of the front window.

[Cocoalicious](#)

Captures the URLs of the selected posts, preserving the tags, description, and extended description.

Cyndicate

Captures the URLs of the selected articles, preserving the label and flagged status.

DEVONagent

Captures the URL of the front browser window.

DEVONthink Pro

Captures the selected items, preserving the comments.

Endo

Captures the selected news items as Web archives, preserving their tags and importing the excerpts as notes.

Entourage

Captures the selected messages or mailbox, preserving the message flags, categories, and projects. If you want EagleFiler to skip a message, you can assign it the category “OmitFromArchive”.

Excel (2004 and later)

Captures the file of the front window (make sure that it’s saved to disk).

Finder

Captures the selected files in the front window.

Firefox

Captures the URL of the current tab. (For some users, Firefox 3 will report an error when EagleFiler asks it for the URL. If this happens, you can import the page by dragging and dropping the URL into EagleFiler.)

Flock

Captures the URL of the current tab.

Google Chrome

Captures the URL of the current tab.

iCab

Captures the URL of the front window.

Journler

Captures the selected documents, preserving the tags, category, comments, and label.

Keynote

Captures the file of the front window.

Mail

Captures the selected messages in the front viewer window. Tags, projects, and annotations from [MailTags](http://www.indev.ca/MailTags.html)³⁰ are preserved, as are the unread/flagged/replied/etc. flags from Mail itself.

³⁰<http://www.indev.ca/MailTags.html>

If [Growl](#)³¹ is installed, it will report on the progress of the capture.

Mailsmith

Captures the selected messages or mailboxes, preserving the message status, label, and notes. You may find it helpful to use [Email Archiver](#)³² to separate messages by age before importing them into EagleFiler.

MarsEdit

Captures the text of current post window or the selected posts, preserving the permalink and the published date.

MindManager

Captures the file of the front window.

Netflix Freak

Captures the URLs of the selected movies.

NetNewsWire

Captures the URL of the current tab, or the URL of the selected headline (if no tab is selected).

Nisus Writer Express

Captures the file of the front window.

OmniGraffle

Captures the file of the front window.

OmniWeb

Captures the URL of the current tab.

Opera

Captures the URL of the current tab.

Outlook

Captures the selected messages or mailbox, preserving the message flags, read status, and categories. If you want EagleFiler to skip a message, you can assign it the category “Omit-FromArchive”.

Pages

Captures the file of the front window.

Path Finder

Captures the selected files in the front window.

³¹<http://growl.info>

³²<http://www.garrison.com.au/freeware/emailarchiver.html>

PDFView

Captures the file of the front window.

PowerMail

Captures the selected messages or mailboxes, preserving the message status and label

Preview

Captures the frontmost document.

Pukka

Captures URL being added, along with the title, tags, and description.

Safari

Captures the URL of the current tab and puts the selected text in a note. Some Web pages (e.g. some sites that require logging in) cannot be captured by loading the URL shown in Safari's location bar. You can import such pages into EagleFiler by using Safari's **File** ▸ **Save As...** command to save the page as a Web archive (perhaps into the **To Import** folder of an EagleFiler library), or by choosing **File** ▸ **Print** and then selecting **Save PDF to EagleFiler** from the **PDF** button menu.

Skim

Captures the file of the front window.

SubEthaEdit

Captures the file of the front window.

TextEdit

Captures the file of the front window.

TextMate

Captures the file of the front window.

TextWrangler

Captures the file of the first document of the front window.

Together

Captures the selected files, preserving the tags, comments, labels, and ratings.

Vienna

Captures the URL of the last selected post.

WebKit Nightly

See description for Safari.

WebnoteHappy

Captures the selected URLs as Web archives, preserving the tags and notes.

Word (2004 and later)

Captures the file of the front window (make sure that it's saved to disk).

Yojimbo

Captures the selected items, preserving the tags, labels, flagged state, and comments.

For applications that are not listed here, there are many other [ways to import](#). For applications that support AppleScript, you can add EagleFiler capture support by [writing capture scripts](#).

3.9 Writing Capture Scripts

You can add support for capturing from additional applications by adding capture scripts to the folder:

```
/Users/<username>/Library/Application Support/EagleFiler/Capture Scripts/
```

A capture script is an AppleScript saved in compiled format. The name of the file is of the form `<bundle identifier>.scpt`, e.g. `com.apple.Safari.scpt`. You can determine an application's bundle identifier by finding the `CFBundleIdentifier` in the `Info.plist` file inside the application's package (which you can open using the **Show Package Contents** command when Control-clicking on the application).

The script should have a handler called `capture` that returns a list of AppleScript records. For example, the NetNewsWire capture script looks like:

```
on capture()
    tell application "NetNewsWire"
        set tabIndex to index of selected tab
        if tabIndex is 0 then
            if exists selectedHeadline then
                set theURL to URL of selectedHeadline
            else
                return {{"error":"No URL is available to be captured."}}
            end if
        else
            set theURLs to URLs of tabs
            set theURL to item (tabIndex + 1) of theURLs
        end if
    end tell
    return {{"url":theURL}}
end capture
```

Each record in the list should have a `|url|` key (for a remote `http` URL) or a `|path|` key (for a full POSIX path). If no items are available for capture, the script can return the empty list, or it can return a record with a `|error|` key that provides an application-specific error message.

The capture script for the Finder demonstrates how to capture multiple items at once:

```
on capture()
    tell application "Finder"
        set theSelection to selection as list
        set theResult to {}
        repeat with theFile in theSelection
            set theFile to theFile as alias
            copy {|path|:POSIX path of theFile} to end of theResult
        end repeat
        return theResult
    end tell
end capture
```

Other, optional, keys are:

`|deleteWhenDone|`

If the script creates a temporary file for the capture, it can include this key with value `true` so that EagleFiler will delete the temporary file after it has finished importing the file.

`|fromName|`

Overrides the From name that would be extracted from the file.

`|note|`

A string for the note text.

`|sourceURL|`

The URL that the document was downloaded from.

`|tags|`

A list of tag names.

`|tagsString|`

A Unicode string of space-separated tag names, which EagleFiler will parse.

`|title|`

Overrides the title that would be extracted from the file.

`|creationDate|`

Sets the creation date of the file.

|modificationDate|

Sets the modification date of the file.

4 Browser Windows

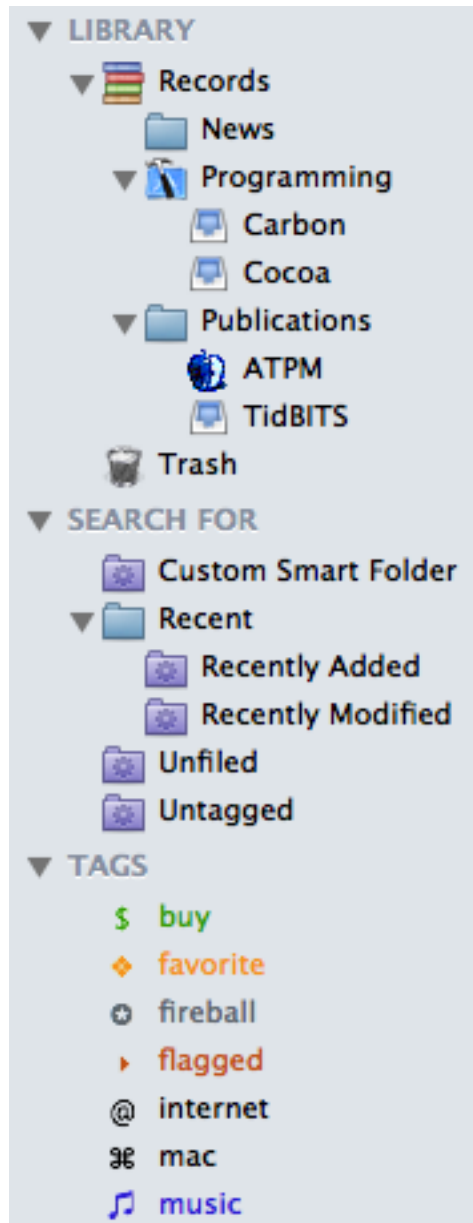

Each browser window contains a source list, a records list, a record viewer, and a toolbar. Drag the split bars to resize the different portions of the window. Double-click a split bar to collapse it entirely. Hold down the Option key while dragging a split bar to grow or shrink the window as you drag.

You can use the Tab key to move between the different panes using the keyboard. When editing in the record viewer, you may need to type Control-Tab rather than Tab (which will insert a tab character into the document).

4.1 Source List

Drag files here to import them. You can drop onto a folder or tag source to import files directly into that folder or to import them and assign that tag. You can use Exposé mid-drag to bring a window to the front and reveal the source that you want to drop onto.

To hide and show the source list, you can use the [Show ▸ Source List](#) command in [The View Menu](#) or drag or double-click the divider.

The top-level sources are:

Library

Records

All the records in the library, from all the folders. Click the triangle next to the **Records** source to see folder sources matching the folders in the library's **Files** folder in the Finder. You can drag and drop files and folders to re-arrange their hierarchy.

Trash

The records that have been deleted from the library, but which are still available until you empty the trash. This corresponds to the library's **Trash** folder in the Finder.

Search For

Recently Added

The last 25 files that were added to the library.

Recently Modified

The last 25 files that were modified within EagleFiler or using another application.

Unfiled

Files that are at the top level of the library, e.g. ones that are directly in the **Files** folder rather than in one of its sub-folders. For example, if you like to categorize all your files into subfolders, **Unfiled** shows you all the files remaining to be categorized.

Untagged

Files anywhere in the library that do not have any tags (other than “note”).

Tags

Tag sources behave like playlists in iTunes or albums in iPhoto. Select a tag source to view all the records with that tag. You can drag records onto a tag source to assign that tag to them. Each record may appear in any number of tag sources. Deleting a record from a tag source unassigns that tag; the record remains in the library. You can drag and drop tags to re-arrange their hierarchy.

You can select more than one source at a time to view all their contents at once or to winnow by tag. For example, to see all the messages in either of two mailboxes, select both mailboxes at once. To see all the flagged files in a folder, select the folder and the **flagged** tag. To see all the records that are both flagged and unread, select both the **flagged** and **unread** tags.

You can type the first few letters of a source's name to select it. Press Return or Enter to edit its name.

4.2 Records List

The records list shows the contents of the selected source(s). If a folder or tag is the selected source, you can drag files into the records list to import them with that folder or tag.

Tags	#	Title	From	Size
☞	53	About This Particular Macintosh 12.09	Michael Tsai	2.0 MB
☞	97	About This Particular Macintosh 12.09	Michael Tsai	1.9 MB
☞	73	About This Particular Macintosh 12.10	Michael Tsai	1.4 MB
☞	51	About This Particular Macintosh 12.10	Michael Tsai	1.6 MB
☞	100	AboutThis Particular Mac 5.10	Michael Tsai	1.6 MB
☞		Apple - Apple - Mac OS X - Leopard Sneak Peek - 64-bit	apple.com	240 KB
☞AS		Apple - iMac	apple.com	420 KB
•		Apple - Mac OS X Leopard - Features - Mail	apple.com	804 KB
•		Apple - Mac OS X Leopard - Features - Quick Look	apple.com	760 KB
•		Apple - Mac OS X Leopard - Features - Spaces	apple.com	780 KB
•		Apple - Mac OS X Leopard - Features - Time Machine	apple.com	736 KB
•		ATPM		35 MB

The columns are:

Tags

The abbreviations for the assigned tags (e.g. ● for **unread**).

Count (#)

The number of pages in a PDF, messages in a mailbox, or attachments in a message.

Icon

An icon that shows the record's type.

Title

The subject of a message or title of a document. For most document types, the title is separate from the filename, e.g. it's set in the **Properties** window in TextEdit and in Microsoft Word. If the title is blank, this column shows the filename.

From

The sender of a message, author of a document, or domain of a Web page.

To

The recipient of a message or document.

Date Modified

The date the record's contents was modified. For a file, this is the file's modification date. For a message, this is when the message was received.

Date Added

The date the record's file was added to the library.

Date Created

The date the record's file was created. For a message, this is when the message was received.

Size

The amount of disk space used by the record.

File

The name of the file containing the record.

Kind

The type of the record.

Label

The Finder label of the record's file.

Container

The name of the folder or mailbox that the record is inside.

Tag Names

The full names of the assigned tags.

Source URL

The URL where the file was downloaded from.

Notes

The record's note text.

-

Whether the record has the “unread” tag.

- ▷

Whether the record has the “flagged” tag.

Drag and drop the column headers to change their order. Click the ▾ or Control-click on a column header to choose which columns are visible.

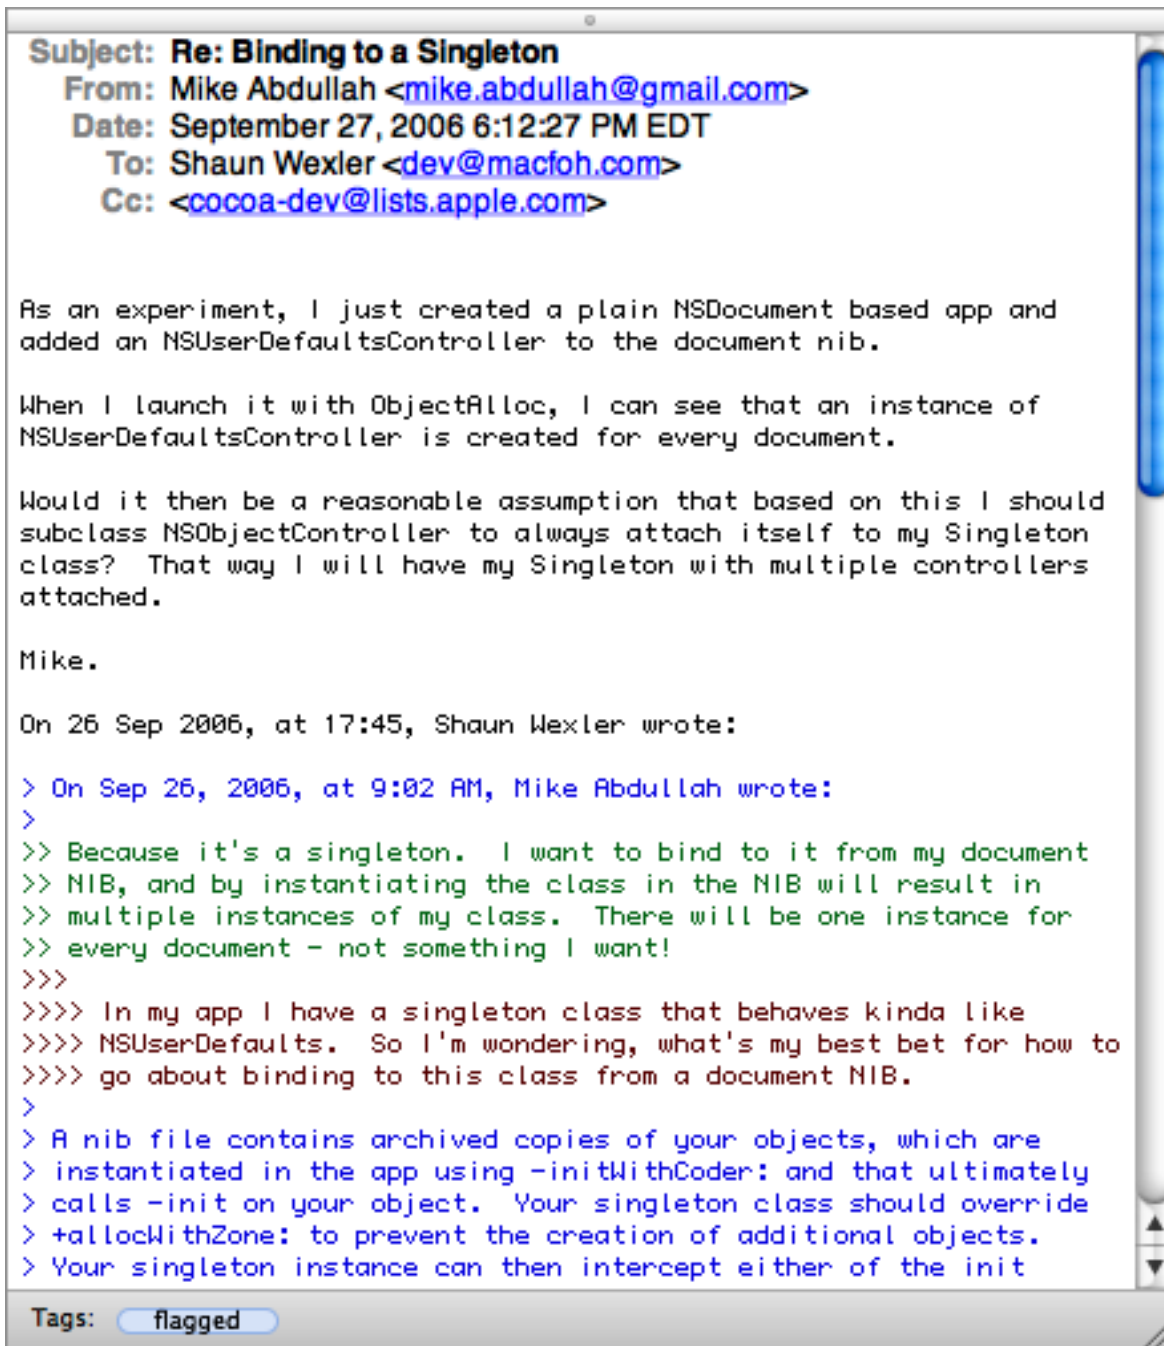

You can type the first few letters of a record's title to select it. Double-clicking a folder or mailbox in the list opens it in the same window. Double-clicking a file is equivalent to choosing [Open With External Viewer](#). Option-double-clicking is equivalent to choosing [Open Source URL](#). Press Enter (or Return) to rename the selected file or Option-Enter (or Option-Return) to change its title.

4.3 Record Viewer

The record viewer shows the contents of the selected file or e-mail message. Text, RTF, and RTFD files can be edited directly in the viewer. EagleFiler automatically saves your changes to disk, and it supports standard features such as spell-checking, find/replace, and text-to-speech.

EagleFiler knows how to display many different kinds of files. If it does not natively understand a file's format, EagleFiler uses [Quick Look](#) to display a preview of the file.

There is also a tags bar at the bottom of the viewer for assigning or unassigning the tags of the current item.

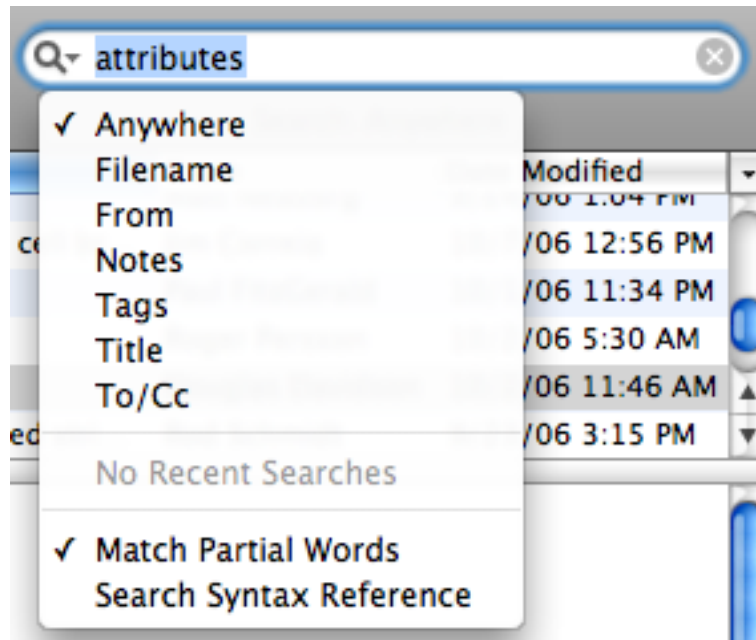

While the record viewer has focus, you can press Command-Delete to delete the current record(s). Control-click on a selected word or phrase to set that phrase as the tag, filename, from, or title.

To hide and show the record viewer, you can use the [Show > Record Viewer](#) command in [The View Menu](#) or drag or double-click the divider.

4.4 Searching

The search box lets you filter the records of the selected sources to display only those records that match the search criteria. After searching, the query is automatically entered into the **Find** panel so that you can search within the current record, e.g. using [Find > Find Next/Previous](#).

There are two kinds of *indexed* searches:

Anywhere

Searches the contents of the records, as well as the Title, From, To, Cc, attachment names, tags, and notes.

Notes

Searches the notes of the records.

These support an enhanced query syntax:

&, AND

Boolean AND. The <space> character also represents a Boolean AND.

|, OR

Boolean inclusive OR.

!, NOT, -

Boolean NOT. For example, `apple -orange` finds records that contain `apple` and do not contain `orange`.

(,)

Opening and closing delimiters for logical grouping. For example, `(apple AND orange) OR (apple AND pear)` finds records that contain `apple` and another fruit, but not ones that contain only `apple`.

"

Opening and closing delimiter for phrase-based searching. Phrase-based searches find records that contain all of the words in sequence.

*

Wildcard for prefix or suffix. Ignored in phrase-based searches. To search for a partial word, use two *'s, e.g. `*ant*` will find `ant`, `repellant`, `anthem`, and words with `ant` in the middle. If **Match Partial Words** is checked, EagleFiler will find partial word matches without your having to type the wildcards each time.

There are also five kinds of *exact* searches:

Filename

Searches the filenames as displayed in the records list.

From

Searches both the names and e-mail addresses.

Tags

Finds records that have the specified tag names. If **Match Partial Words** is not selected, tag searching is exact, so you must type the complete tag names (with the proper case).

To/Cc

Searches both the names and e-mail addresses.

Title

Searches record titles and message subjects.

For both indexed and exact searches, you can restrict a search to records with certain tags by adding `tag:<tagname>` at the beginning of the query. (This syntax is not available in smart folders; there you should create a separate **Tags** criterion.) The search will then match only the records with *all* of those tags. For example, searching for `tag:apple steve` means to search for `steve` and show

only the records with the `apple` tag. Searching for `tag:mac tag:ipod halo !bungie` means to find all the records that include the word `halo`, do not include the word `bungie`, and have both the `mac` and `ipod` tags.

To perform complex searches with multiple criteria, use the [New Smart Folder...](#) command.

5 Menus

5.1 The EagleFiler Menu

5.1.1 About EagleFiler

The **About EagleFiler** window shows the credits, as well as download and support information.

You can always download the latest version of EagleFiler from the [EagleFiler Web site](#)³³.

Questions about EagleFiler may be sent to eaglefiler@c-command.com³⁴. We're always looking to improve EagleFiler, so please feel free to send any feature requests to that address.

To make sure that you have the latest version of EagleFiler, you can use the *Software Update...* command.

5.1.2 Software Update...

Click the **Check Now** button, and EagleFiler will tell you whether a newer version is available for download. By default, EagleFiler will automatically check for new versions each time it is launched and once per day. You can disable this feature by unchecking the checkbox.

If a new version is available, EagleFiler will tell you what's new in that version. Click **Download** to have EagleFiler download the `.dmg` file for the new version to your Internet downloads folder. (You can change the folder in Safari's preferences.) Click **Download & Install** to have it download the `.dmg` and then update the installed EagleFiler application to the new version.

To check for a new version, EagleFiler contacts a Web server at `c-command.com`. EagleFiler transmits the following information to the server: the name of the product (EagleFiler) and its version, the version of Mac OS X, whether EagleFiler has been purchased, the values of certain esoteric preferences, and the name of the current language. This information is used to guide future development. No personal information is transmitted.

³³<http://c-command.com/eaglefiler/>

³⁴<mailto:eaglefiler@c-command.com>

5.1.3 Purchase...

This window lets you buy EagleFiler. If you've already purchased EagleFiler but it's running in demo mode, you can enter your name and serial number to personalize your copy of EagleFiler and remove the demo limitations.

EagleFiler has a free trial period that lasts for 30 days or 7 launches, whichever is longer. To use EagleFiler beyond the demo period, you must purchase it. This entitles you to free updates and support.

To purchase, choose **Purchase...** from the **EagleFiler** menu. You can use the **Purchase Online** button to enter the online store.

Soon after paying, you'll receive an e-mail with your serial number. Enter the name and serial number from the e-mail into the **Purchase** window and click **Personalize**. If you need to re-install EagleFiler, you can simply re-enter your name and serial number and click **Personalize**; there's no need to purchase again.

If you purchased EagleFiler but cannot find your serial number, click the **Look Up My Serial Number** button. This will open a form where you can enter your e-mail address and look up your order information.

A license for EagleFiler is good for one person *or* one computer. You can install it on one Mac, and everyone sharing that Mac can use it (on that Mac). Alternatively, you can install it on your desktop Mac and your laptop; you can then use it on either machine, provided that no one is using it on the other machine.

5.2 The File Menu

5.2.1 New Library...

Creates a new library. Double-click the `.eflibrary` file to open the library in EagleFiler. You can move the [library folder](#) around in the Finder, so long as it isn't currently open in EagleFiler.

See also:

- [How can I encrypt my files?](#)
- [How can I access my library from multiple Macs?](#)

5.2.2 New Record ▸ Rich Text File

Creates a new, empty RTF or RTFD file inside the selected source.

If the **File** column is visible and editing is enabled, EagleFiler brings the filename into edit mode so that you can set the name of the newly created file. When you're done, press Tab or click in the viewer to begin entering the contents of the file. If the **File** column is hidden or editing is disabled, EagleFiler opens a sheet that lets you enter the name of the new file.

If you hold down the Option key when clicking the **New RTF** button, EagleFiler creates a new plain text file.

5.2.3 New Record ▷ Plain Text File

Creates a new, empty plain text (UTF-8) file inside the selected source.

If the **File** column is visible and editing is enabled, EagleFiler brings the filename into edit mode so that you can set the name of the newly created file. When you're done, press Tab or click in the viewer to begin entering the contents of the file.

If the **File** column is hidden or editing is disabled, EagleFiler opens a sheet that lets you enter the name of the new file. If you enter a name containing an extension, EagleFiler uses that; otherwise, it adds `.txt` as the file extension.

As a shortcut, you can Option-click the **New RTF** toolbar button to create a new plain text file.

5.2.4 New Record ▷ From Clipboard

Creates a new RTF or RTFD file inside the selected source. The content of the file is taken from the clipboard. In a way, you are creating a new file in EagleFiler by “pasting,” and the keyboard shortcut of Command-Shift-V reflects this.

5.2.5 New Record ▷ Open Stationery Folder

You can create any type of new file from within EagleFiler. Whichever files you put in the **Stationery** folder become available as templates in the **File ▷ New Record** menu. You can assign keyboard shortcuts for them from the **Keyboard** pane in System Preferences.

Setting Metadata via the Finder

You can edit the stationery file in the Finder in order to control the metadata that EagleFiler assigns when creating a new record from the stationery. For example, you can assign a label or add Spotlight comments. The new record will have the same label as the stationery file, and the Spotlight comments will control the tags and notes. To set the tags to “journal” and “draft” and the note to “This is the note.”, set the Spotlight comments to:

```
&journal &draft This is a note.
```

Setting Metadata via AppleScript

You can also set the metadata via AppleScript. This provides more control—for example, you can set a title that’s distinct from the filename. It also lets you set the metadata dynamically—that is, it can be determined when making new records from the stationery rather than when the stationery is first created. Therefore, the metadata can be based on the current date, the current user, the current iTunes track or iChat status, or any other information that’s accessible via AppleScript.

To set the metadata via AppleScript, create a compiled script file next to your stationery file. If the stationery file is `Journal Entry.rtf`, the script should be called `Journal Entry.efmeta.scpt`. EagleFiler will automatically run the script when you create a new record from the `Journal Entry.rtf` stationery.

Here’s an example metadata script:

```
on metadata(_context)
    set _title to "Blog Entry"
    set _base to do shell script "date '+%A, %B %d, %Y'"
    set _systemInfo to system info
    set _from to long user name of _systemInfo
    set _tags to {"journal", "draft"}
    return {|title|: _title, |basename|: _base, |fromName|: _from, |tags|: _tags}
end metadata
```

This would set the title to “Blog Entry”, the filename would be based on the current date (e.g. “Tuesday, October 21, 2008.rtf”), the from would be the name of the user logged into the Mac (e.g. “John Appleseed”), and the tags would be “journal” and “draft”.

Metadata Script Details

The script should contain a handler called `metadata` with a single context parameter.

The context is an AppleScript record containing the following keys: `|folderName|`, `|libraryPath|`, `|stationeryBasename|`, `|stationeryName|`, and `|stationeryPath|`. The script can ignore the context, or it can use it to find out about the stationery file and where the record will be created.

The `metadata` handler should return an AppleScript record containing one or more of the following keys: `|basename|`, `|fromName|`, `|note|`, `|sourceURL|`, `|tags|`, `|title|`.

5.2.6 New Folder...

Creates a new folder in the [source list](#) of the current library. You can set a custom icon for the folder by selecting it in the Finder, choosing **File** ▸ **Get Info**, clicking on the icon, and pasting your own image.

If a smart folder is selected, creates a folder for holding smart folders rather than a folder for holding files.

5.2.7 New Tag

Creates a new tag and selects it in the [source list](#). If records are selected, they are assigned the new tag. If a tag is selected, the new tag becomes a subtag of that tag. You can drag and drop tags to re-arrange their hierarchy.

5.2.8 New Browser Window

Creates an additional [browser window](#) for viewing the contents of the current library.

5.2.9 New Smart Folder...

A smart folder is like a saved search; it shows records in the library that match certain criteria. EagleFiler has four built-in smart folders: **Recently Added**, **Recently Modified**, **Unfiled**, and **Untagged**. This command lets you create your own smart folders.

You can organize smart folders into folders. To do this, select a smart folder and choose [New Folder...](#) Then re-arrange the smart folders using drag and drop.

Creating and editing smart folders requires Mac OS X 10.5 or later; however, once created, the smart folders can be used with Mac OS X 10.4.

5.2.10 Edit Smart Folder...

The **Conditions** tab lets you set the criteria that determine which records are shown in the smart folder.

Search inside

This pop-up menu lets you select a folder, a mailbox, or the entire library to determine which records the smart folder can display.

subfolders

If this is checked, EagleFiler searches the entire contents of the folder or library. If it's unchecked, it only searches the first level of files in the folder.

mailboxes

If this is checked, when EagleFiler encounters a mailbox it searches the messages inside of it. If you don't need to search the messages, unchecking this will make the search go faster.

Now that you've chosen *which* records EagleFiler will search, you can create an unlimited number of criteria to narrow down the results. Click + to add a criterion or - to remove one. Option-click + to add a new Any/All/None grouping of criteria. You can drag and drop to re-arrange the criteria.

The possible criteria are:

Anywhere

Searches the contents of the records, as well as the Title, From, To, Cc, attachment names, and notes (but not tags). The detailed search options are described in the [Searching](#) section.

From

The names and e-mail addresses.

To/Cc

The names and e-mail addresses.

Title

Record titles and message subjects.

Count

The number of pages in a PDF, messages in a mailbox, or attachments in a message.

Source URL

The URL that a record was downloaded from.

Label

The Finder label of the record's file.

Notes

The notes, set in the **Info** inspector.

Tags

The full names of the assigned tags.

Filename

Searches the filenames as displayed in the records list.

Size

The amount of disk space used by the record.

Kind

The type of the record, as shown in the records list.

Container name

The name of the folder or mailbox that the record is inside.

Date added

The date the record was added to the library.

Date created

The date the record's file was created.

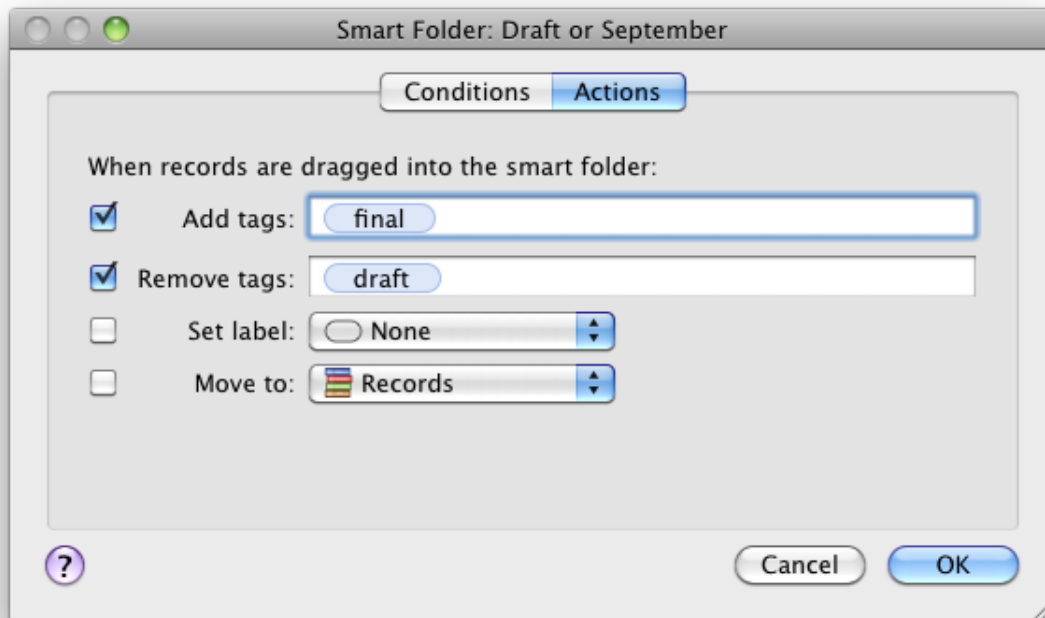

Date modified

The date the record's contents was modified. For a file, this is the file's modification date. For a message, this is when the message was received.

Every record

This is useful when combined with **subfolders** and **mailboxes**. When you click on a folder in the source list, EagleFiler shows only the immediate contents of the folder. If you create a smart folder using **Every record**, EagleFiler will show the contents of the folder *and of its subfolders*.

The **Actions** tab lets you control what happens when you drag a record onto the smart folder. Actions can add tags, remove tags, set the label, or move the records to a folder.

Creating and editing smart folders requires Mac OS X 10.5; however, once created, the smart folders can be used with Mac OS X 10.4.

5.2.11 Open Library...

Opens a `.eflibrary` file, letting you view the library in EagleFiler.

When you open a library, EagleFiler will automatically verify that all of the files are present, [backup the metadata](#), and [copy the tags to the Spotlight comments](#) (if you've selected that option). To skip these operations, hold down the Shift key when opening the library.

If you hold down the Command and Option keys when opening a library, EagleFiler will show the **Rebuild Indexes** dialog. Rebuilding increases the speed of Anywhere and Notes searches, compacts the index, and repairs any damage to it. For example, you might want to rebuild the indexes if you've deleted a lot of files from the library, or if an Anywhere or Notes search is not finding a record that you think should be in the index.

When rebuilding an index you can choose whether EagleFiler should index *words* or *phrases*. Indexing for word searches is much faster, but searching for multiple words will find all the documents that contain those words *anywhere in the document*. Indexing for phrase searches lets you search for a group of words *that appear near each other* in a document, however indexing will take longer and the index files will be several times as large.

5.2.12 Close & Lock

Closes an encrypted library and ejects its disk image. Accessing the library again will require its passphrase.

5.2.13 Scan for New Files

An easy way to add new files to your EagleFiler library is to save new files (or move existing files) directly into the **Files** folder in the **library folder**. When EagleFiler scans the library folder, it will import the new files in-place (without copying them) and assign tags and notes based on the Spotlight comments and OpenMeta. When importing in this manner, EagleFiler does not skip duplicate files; any file that you specifically add to the library folder will stay there.

EagleFiler scans the **Files** folder for new files when you open the library. In this way, files added since the last session will be auto-imported. Unlike with the **To Import** folder, EagleFiler does *not* automatically scan the **Files** folder for new files once the library is open. This is to prevent accidentally importing files (or packages) that are in the midst of being saved, which could lead to duplicate files or data corruption. Instead, you can manually trigger a scan at an opportune time (i.e. when you are not in the midst of copying or saving new files) by choosing **Scan for New Files** from the **File** menu or by invoking that command via AppleScript.

There may be cases where you want to prevent certain files from being auto-imported by a scan. To hide the contents of a folder from EagleFiler, assign it the `ef_unscanned` tag. This will let you store files in that folder in the Finder, without having EagleFiler detect them, import them, and clutter up its window.

You can also use the `UnscannedExtensions` default to make the scan ignore files of certain types inside of an already-imported folder. For example, to prevent EagleFiler's scan from picking up temporary files generated by LaTeX, you could type this command into Terminal:

```
defaults write com.c-command.EagleFiler UnscannedExtensions -array aux out toc
```

5.2.14 Import URLs...

Opens a sheet for importing one or more URLs into the current library, using the [Web page format](#) chosen in the preferences. The text field will be pre-filled with the contents of the clipboard. If you enter a URL that's not for a Web page (e.g. the URL of a PDF or image file) EagleFiler imports the file directly rather than converting it to a Web archive, PDF, etc.

5.2.15 Import Files...

Opens a sheet that lets you choose one or more files or folders to be imported into the current library.

5.2.16 Export...

Opens a sheet that lets you choose a folder to which the selected records will be exported.

- The selected files/folders will be copied into the folder.
- Individual selected e-mail messages will be exported as a single mailbox file. To access the messages, import them into a mail program or EagleFiler.

Please note that, because [the library is open](#), it is not necessary to export files in order to open them with other applications. You could instead use the [Open With External Viewer](#) or [Reveal In Finder](#) commands. The **Export...** command is intended for when you want to make copies of the selected files or when the selected records are scattered throughout the library so that they would not be easy to access from the Finder.

EagleFiler natively stores e-mail as mailbox files using the standard mbox format. All Mac e-mail programs can import files in this format. Here are specific instructions for some common e-mail programs:

Apple Mail

Choose **File** > **Import Mailboxes...**, select the **mbox files** radio button (or **Other** if you have Mac OS X 10.4), click **Continue**, and then choose the folder containing the exported mailbox file.

Entourage

Choose **File** > **Import...**, select the **Contacts or messages from a text file** radio button, then click the right arrow. Select the **Import messages from an MBOX-format text file** radio button and click the right arrow. Select the file and then click the **Import** button.

Note: If you're unable to import a mailbox file that's stored in EagleFiler, it may help to select the messages and export them as a new mailbox file. This is because EagleFiler *stores* the messages exactly as you imported them, and some mail programs are not very tolerant of format differences. When you *export*, EagleFiler tries to convert the messages to as standard a format as possible, and this can lead to more successful imports.

5.2.17 Backup Metadata

Metadata is EagleFiler-specific information such as a record's title, from, checksum, source URL, tags, and notes. It is stored inside the `.eflibrary` file.

EagleFiler will automatically backup a library's metadata when it's opened and also periodically thereafter. You can manually backup the metadata by holding down the Option key and choosing **Backup Metadata** from the **File** menu.

Metadata is backed up to invisible XML `EagleFiler Metadata.plist` files inside the library folder. These are standard Mac OS X property lists that can be viewed in TextEdit and processed by many other programs.

The backups allow EagleFiler to reconstruct all of your metadata if the `.eflibrary` file is damaged or deleted. To restore a library:

1. Create a new library.
2. Import the contents of the old library's **Files** folder. EagleFiler will copy the files into the library (preserving their hierarchy) and automatically restore the metadata from the backup.
3. Close the library.
4. In the Finder, replace the contents of the new library's **Smart Folders** folder with the contents of the old library's **Smart Folders** folder.

5.2.18 Empty Trash...

Empties the trash of the current library. Hold down the Option key to skip the warning.

5.2.19 Print

EagleFiler will print either the list of records or the contents of the record viewer, depending on which you have clicked on.

5.3 The Edit Menu

5.3.1 Undo/Redo

Most actions in EagleFiler can be undone and redone, and EagleFiler supports multiple levels of undo. When you close a library or empty the trash, EagleFiler clears the list of undoable actions for that library.

5.3.2 Copy

Copies the selected text, the titles of the selected records or sources, or the names of the selected tags.

5.3.3 Copy Source URL

Copies to the clipboard the original `http` URLs for files that were imported from Web pages.

5.3.4 Copy Record Link

Copies a `x-eaglefiler` URL to the clipboard for each selected record. Opening the URL will launch EagleFiler, open the library, and select the record so that its contents are shown in the source list or viewer.

Instead of copying and pasting, you can also drag a record into a text view to create a link to it.

Links will continue to work as you re-arrange the files within the library. However, if you move the library folder or rename the `.eflibrary` file in the Finder, previously copied `x-eaglefiler` URLs for that library will break. Links to individual e-mail messages will break if you merge the message's mailbox with another mailbox, as that will delete the original mailbox.

Another way to use record links is to select some records in EagleFiler and choose a command from the **Services** menu, e.g. **Text Edit** ▸ **New Window Containing Selection** or **OmniFocus: Send to Inbox**. This will send the record links to that application without your having to copy and paste.

5.3.5 Paste/Paste and Match Style

Regular **Paste** preserves the font and style information from the copied text. This means that the pasted text may not fit in with its surroundings.

Paste and Match Style is like converting the clipboard to plain text before pasting. Any formatting is removed. The pasted text will blend in with the surrounding text.

5.3.6 Find ▸ Library Search...

Brings the focus to the search field in the current [browser window](#) so that you can search the library for the records that are of interest. This is described in the [Searching](#) section. After searching, the query is automatically entered into the **Find** panel so that you can search within the current record, e.g. using [Find ▸ Find Next/Previous](#).

5.3.7 Find ▸ Find...

Opens the **Find** panel so that you can find (or replace) text within the current record. You can hold down the **Option** key when clicking the **Replace All** button to make it only replace within the selection.

5.3.8 Find ▸ Find Next/Previous

If the query has already been set (using [Find ▸ Find...](#) or [Find ▸ Use Selection for Find](#)), jumps to the next (or previous) occurrence within the current record.

5.3.9 Find ▸ Use Selection for Find

A shortcut for entering the selected text into the **Find** panel. This, combined with [Find ▸ Find Next/Previous](#), makes it possible to search within a record without having to open the **Find** panel.

5.4 The View Menu

5.4.1 Message ▸ Raw Source

If this is checked, the viewer will show the raw [RFC-822](#)³⁵ source for e-mail messages. If it's unchecked, the viewer will instead show the decoded Subject, From, Date, To, and body of the message.

³⁵<http://www.ietf.org/rfc/rfc0822.txt>

5.4.2 Message ▷ Plain Text

If this is checked, EagleFiler will show all e-mail messages in plain text format. For HTML-only messages, a plain text representation will be created. If this is unchecked, HTML messages will be shown using rich text and plain text messages will be shown in plain text.

5.4.3 PDF ▷ Next/Previous Page

These commands let you control which page of a PDF is displayed in the [record viewer](#). There are several ways to change the page without using the menu bar:

- Click on the PDF page, so that it gets keyboard focus, and then press the Down or Up arrow key. In order for this to work, **View ▷ Zooming ▷ Zoom to Fit** must be checked.
- Press Command–Left Arrow or Command–Right Arrow.
- Control-click on the PDF page and use the commands in the contextual menu.
- Use the **View ▷ Customize Toolbar** command to add **Next** and **Previous** toolbar buttons for changing the page.
- Use the **Keyboard** pane of **System Preferences** to change the keyboard shortcuts for **Next Page** and **Previous Page**.

5.4.4 Show ▷ Source List

Hides or shows the [source list](#). As a shortcut, you can double-click on the divider.

5.4.5 Show ▷ Record Viewer

Hides or shows the [record viewer](#). As a shortcut, you can double-click on the divider.

5.4.6 Show ▷ Deleted Messages

E-mail messages that you've deleted are still stored in their mailbox files, but they are hidden from view. This option lets you see all of the messages, even the deleted ones. To undelete a message, select it and press Delete.

5.4.7 Show ▷ Messages in Records Source

If this is checked, EagleFiler will show e-mail messages (from all your mailboxes) as well as files in the **Records** source. Uncheck it if you want to avoid the clutter of seeing all the e-mail messages, or if viewing the library is slow because you have lots of messages. This setting is saved per-library.

5.4.8 Show ▷ Messages in Tag Sources

If this is checked, EagleFiler will show e-mail messages (from all your mailboxes) as well as files in tag sources. Uncheck it if you want to avoid the clutter of seeing all the e-mail messages, or if viewing tag sources is slow because you have lots of messages. This setting is saved per-library.

5.4.9 Allow Editing in Record Viewer

This controls whether Text, RTF, and RTFD records can be edited directly in the [record viewer](#), without opening the file in another application. You might uncheck this if you want to avoid making accidental changes while viewing a record.

5.4.10 Open in New Window

This opens a new [browser window](#) in EagleFiler and selects the current record. If more than one record is selected, EagleFiler opens one window per record.

A shortcut for this command is to double-click an item in the source list.

5.5 The Go Menu

The commands at the bottom of this menu let you quickly jump to key items in the [source list](#): **Records**, **Recently Added**, **Recently Modified**, **Unfiled**, **Untagged**, **flagged**, and **unread**.

5.5.1 Enclosing Record

View the container of the current folder or mailbox (i.e. go up a level in the hierarchy). For example, if you have a file selected in the records list, this will select the file's folder in the records list. If you have a folder selected in the source list, this will select the containing folder in the source list.

5.5.2 Contents of Record

View the contents of the selected folder or mailbox (i.e. go down a level in the hierarchy). For example, if the **Records** source is selected, you can use the search box to enter the name of the folder or mailbox that you want to view, select it in the record list, and then choose **Contents of Record**. This is often quicker than expanding the various folders inside the **Records** source to find the one you want.

If a message or non-mailbox file is selected, **Contents of Record** will instead say **Reveal in Container**, and it will select the containing mailbox or folder in the source list and select the message or file in the records list. This lets you search for a message or file in **Records**, a tag source, or a smart folder, and then reveal it in its original context.

5.5.3 Previous/Next Record

These commands select the previous or next record in the record list. This lets you change which record is being viewed while the viewer pane has keyboard focus.

When the [records list](#) or the [record viewer](#) has keyboard focus, you can type Spacebar or Shift-Spacebar to select the next or previous record.

5.6 The Record Menu

5.6.1 Mark as Unread/Read

Add (or remove) the “unread” tag to the selected records.

5.6.2 Mark as Flagged/Unflagged

Add (or remove) the “flagged” tag to the selected records.

5.6.3 Tag

Gives keyboard focus to the tags text field at the bottom of the browser window, which lets you edit the tags of the selected record.

5.6.4 Edit Notes

Opens the **Info** inspector and places the insertion point in the **Notes** field.

5.6.5 Set Label

Lets you set the Finder label of the selected records. Since e-mail messages do not appear as distinct files in the Finder, setting the label of a message sets the Finder label of the message's mailbox.

5.6.6 Move To

Moves the selected records to another folder.

5.6.7 Batch Change...

This window lets you set the title, from name, label, tags, and notes of multiple selected records at once. You can either **Append** or **Replace**. For example, appending tag **mac** will add that tag to the selected records, while **Replace** would add the **mac** tag and remove any pre-existing tags.

There are keyboard shortcuts for **A**ppend (Shift-Command-A), **R**eplace (Shift-Command-R), **L**abel (Command-3), **C**ancel (Command-. or Escape), and **O**K (Enter).

5.6.8 Convert for Editing

Converts the selected Web archives to (editable) rich text files, preserving the tags, notes, source URL, and other metadata.

The `ImportTextAsWebArchive` [esoteric preference](#) can be used to make selected Web text always import in rich text rather than Web archive format, so that it's not necessary to convert for editing.

5.6.9 Verify

When you open a library, EagleFiler checks that all the files and notes are present. The **V**erify command does this, and it additionally checks that their *contents* are what EagleFiler was expecting. To verify the entire library, select the **R**ecords source and choose **V**erify. You can also verify individual files or folders.

This can help you detect file corruption before it becomes a serious problem. For example, if there

is damage to your disk and a file becomes corrupt, you'll learn of the problem as soon as you use the **Verify** command. Without **Verify**, you would only learn of the problem when you tried to access the file (perhaps a long time in the future), and perhaps not even then, because the corruption might not be readily apparent. Because you learn about the damage early, you can restore a correct version of the file from a backup, rather than filling your future backups with damaged copies of the file.

In order to detect when files have changed, EagleFiler stores a checksum of each file. If EagleFiler reads a file and calculates the same checksum that it got before, it knows that the file has not changed. Thus, if the file was in good condition before, it is still in good condition. If EagleFiler calculates a different checksum, that means that the file's contents are different.

Sometimes, the checksum *should* be different. For example, when you edit a file, you intentionally change its contents, resulting in a different checksum. When you edit a file within EagleFiler, EagleFiler automatically updates its stored checksum to match the file's new contents. Thus, if you only edit files using EagleFiler, the checksums will always be in sync with the files' contents, and any checksum that doesn't match means that the file is damaged.

EagleFiler also allows you edit files using other applications. For example, you can double-click a Microsoft Word document to open it in Word, make some changes, and choose **File** > **Save**. In this case, the file has changed, but there is no way for EagleFiler to know that this is because of what you did in Word. The changes *could* have been due to damage. Thus, if you edit a file outside of EagleFiler, you must use the [Update Checksum](#) to tell EagleFiler that the file's current contents are correct. EagleFiler will then update its stored checksum to match.

Verify is a specialized feature for people who want *extra* data integrity protection. If you don't need this, or if you frequently edit files outside of EagleFiler and don't want to have to **Update Checksum**, then you can simply ignore the **Verify** command. EagleFiler will then behave like a normal Mac application: it won't complain about files being different than it expected, but neither will it detect when they are damaged.

5.6.10 Update Checksum

The **Update Checksum** command tells EagleFiler that you have edited the selected file(s) using another application. This is necessary for proper operation of the [Verify](#) command and [duplicates detection](#).

If you do not edit files outside of EagleFiler, or if you do not use **Verify** or [duplicates detection](#), you can ignore the **Update Checksum** command.

5.6.11 Merge Mailboxes/Message Files

Merges the selected mailboxes (or .eml files) into a single mailbox file with the name and location of the oldest mailbox (or .eml file) in the selection. The tags and notes of the messages are preserved. The original files are then moved to the trash.

Merging can reduce clutter in the [source list](#) and speed up EagleFiler.

5.6.12 Reply to Message

Lets you reply to a message in your default e-mail program.

5.6.13 Open With External Viewer

Opens the selected records in a specialized viewer application such as Preview, Safari, or Mail. Folders and mailboxes will open in a new window in EagleFiler. If you open an e-mail, the message that's displayed in Mail is the message that's stored in EagleFiler's library, not the original message that was imported from Mail (which might already have been deleted).

If a search is in effect, EagleFiler passes the search string to the external viewer so that it can show you the matches in the document.

Double-clicking a record is a shortcut for choosing this command from the menu. Hold down the Option key to open the source URL instead of the stored file.

To open the record using an application other than the default, use the [Open With](#) command.

5.6.14 Open With

The **Open With** submenu lets you temporarily override the default application for opening a file. For example, perhaps you normally open PDF files using Preview, but in a particular circumstance you want to use Adobe Reader instead. To do this, select the file and choose **Open With** ▸ **Adobe Reader** from the **Record** menu or the contextual menu.

The **Always Open With** submenu lets you change the default application for *all* files of a particular content type ([UTI](#)³⁶). For example, perhaps you want all your HTML files to open in BBEdit when double-clicked.

To change the default application for a particular file, use the [Reveal in Finder](#) command, then choose **Get Info** from the Finder's **File** menu and look in the **Open with** section of the info

³⁶<http://en.wikipedia.org/wiki/Uniform.Type.Identifier>

window.

5.6.15 Open Source URL

With a Web archive record (or an RTFD file converted from a Web archive) selected, this opens the (live, not archived) Web page in your Web browser.

You can also Option-double-click on a record to open its source URL.

5.6.16 Open in Delicious

This opens a Web archive's URL in the [Delicious](http://delicious.com)³⁷ social bookmarking site to help you find related pages.

5.6.17 Quick Look

EagleFiler uses Apple's [Quick Look](#)³⁸ technology to preview in the record viewer files that it doesn't natively understand. The **Quick Look** menu command lets you open a larger preview window.

You can Quick Look multiple records at once to compare thumbnails of them in the Quick Look window.

A shortcut for opening the Quick Look window is to press the Spacebar when in the records list.

5.6.18 Slideshow

Opens a full-screen Quick Look window to view the selected records. To see this menu command, hold down the Option key.

A shortcut for opening the Quick Look window is to press Option-Spacebar when in the records list.

The **Slideshow** feature requires Mac OS X 10.6.

³⁷<http://delicious.com>

³⁸<http://www.apple.com/macosx/features/quicklook.html>

5.6.19 Reveal in Finder

This shows the selected records in the Finder. If you have [Path Finder](#)³⁹ running, the files will be revealed in it instead.

5.7 The Format Menu

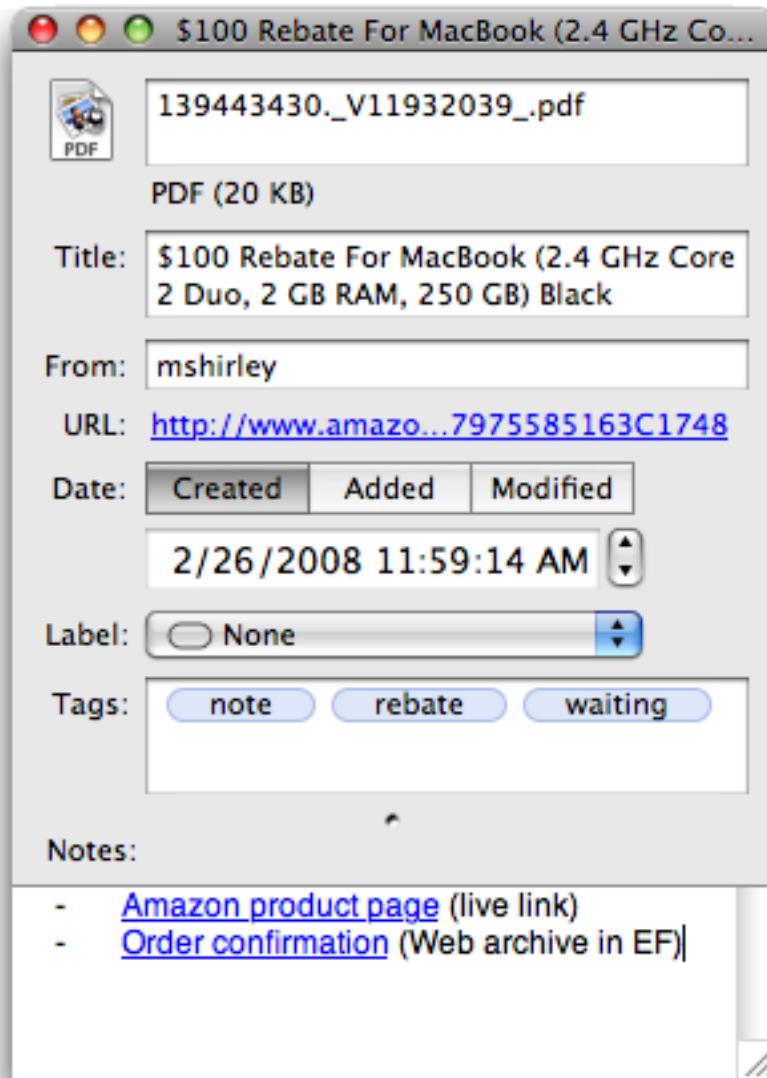

This menu contains commands for use when editing a rich text file in EagleFiler's viewer or when editing a note. You can change the font and style and add clickable links, lists, and tables. In addition to the standard Mac OS X formatting commands, EagleFiler provides a command called **Highlight**, which makes the background of the selected text yellow, as if it had been drawn over with a highlighter.

5.8 The Window Menu

5.8.1 Show Info

This window lets you view and edit the properties of the selected records. You can type Tab to move between text fields, or Control-Tab to move out of the notes text view.

³⁹<http://www.cocoatech.com>

File Properties

This shows the file's name, kind, size, and dates, as well as EagleFiler metadata such as the title, source URL, and from.

If the file didn't have an embedded title (or you set the title to be blank), EagleFiler will use the filename (without the extension) as the title, and the title will stay in sync with the filename if you rename it.

Label

This is the Finder label of the file. In EagleFiler, the label is shown as the background color in the records list and also in the **Label** column. E-mail messages are stored as mailboxes, not as individual files, so all the messages in the mailbox share the mailbox file's label. You can edit the label names from the Finder's **Preferences** window.

Tags

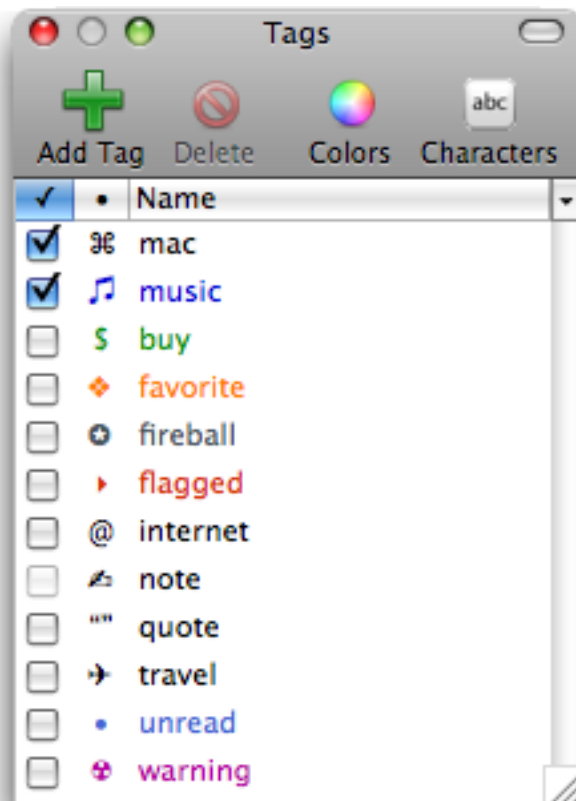

This shows the tags assigned to the record. You may find it more convenient to create and assign tags by typing them in the text field than by using the [Show Tags](#) command.

Notes

Notes support rich text, clickable links, embedded graphics, tables, etc. Most of the commands for editing notes are in the **Format** menu. As a shortcut, you can type Option-Tab to start a bulleted list or Option-Shift-Tab to dedent the current list item. EagleFiler automatically adds the “note” tag to records that have notes, and removes it from ones that don’t.

5.8.2 Show Tags

This window shows a list of [tags](#) for the current library.

The columns are:

✓

The box is checked if all of the selected records in the browser window have this tag. It shows a - sign if some (but not all) of the selected records have the tag. It is disabled if no records are selected.

-

The abbreviation (if any) for the tag. Abbreviations are shown in the **Tags** column of the records list; for example, the “unread” tag is shown as a blue •. Double-click on an abbreviation to edit it. The abbreviation can be composed of ordinary letters, or of special symbols. To enter a special symbol, first double-click to edit the abbreviation. Then click the **Characters** button to open the **Character Palette**. Make sure that you are using a **View** that does *not* have a **Font** pop-up menu; this way you can ensure that you enter a true Unicode character. Click on the character that you want, then click the **Insert** button.

Name

The name of the tag. Double-click on a name to edit it. (The names of built-in tags such as “unread” cannot be edited.) Each tag must have a unique name.

You can give the tags palette keyboard focus by:

- Clicking in its title bar.
- Choosing **Show Tags** from the **Record** menu.
- Clicking the **Tags** button in the toolbar of a browser window.
- Editing an abbreviation or name.

Once the tags palette has keyboard focus, you can:

- Type the first few letters of a tag’s name to select it in the list.
- Press the spacebar to toggle whether the selected records in the browser window have the selected tags. This is like checking or unchecking the boxes of all the selected tags at once.
- Click the **Colors** button in the toolbar. Then choose a new color for the selected tag(s) and abbreviation(s).

You can Control-click on a tag to reveal it in the source list, thus showing all the records with that tag.

5.8.3 Show Tag Cloud

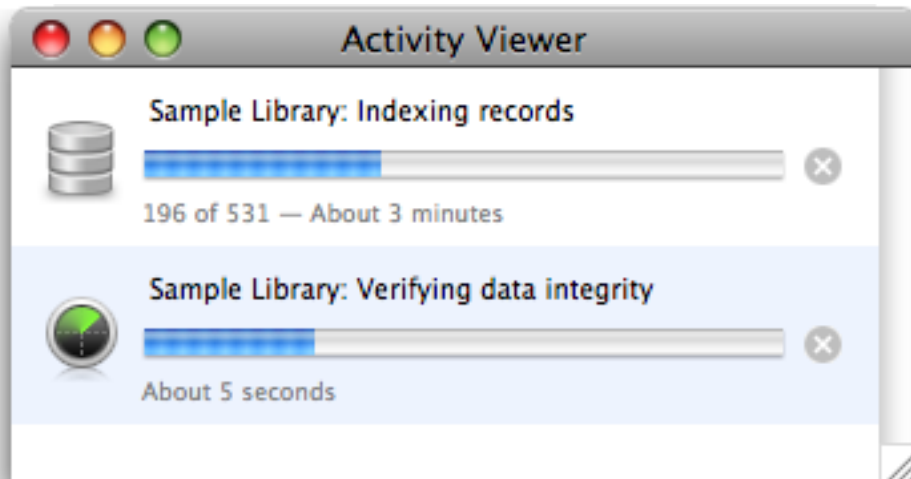

The **Tag Cloud** window shows a compact listing of all the tags. You can click on a tag to toggle whether it’s assigned to the selected record(s).

A shortcut for opening the **Tag Cloud** window is to Option-click the **Tags** button in the toolbar.

5.8.4 Activity

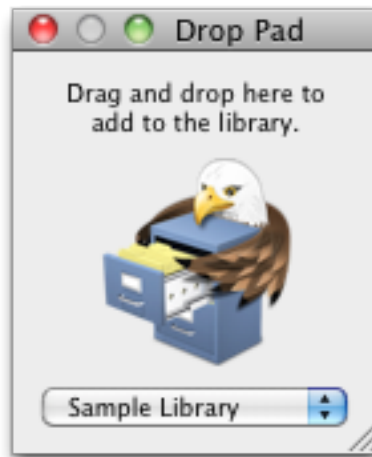

EagleFiler can do many operations—such as adding files and URLs to the library, indexing, verifying—in the background. This window shows a list of the tasks that EagleFiler is currently working on for each library.

A shortcut for opening the **Activity** window is to click the progress spinner at the bottom of a browser window.

5.8.5 Drop Pad

The Drop Pad tells you which library is active. You can drag files onto the Drop Pad to [import](#) them into the active library. You can use the pop-up menu on the Drop Pad to change the active library (without introducing window clutter). The Drop Pad also provides information about whether EagleFiler can [capture](#) from the current application.

5.8.6 Errors

This window shows a list of errors that have occurred since you launched EagleFiler. You can select errors and copy them to the clipboard.

5.9 The Help Menu

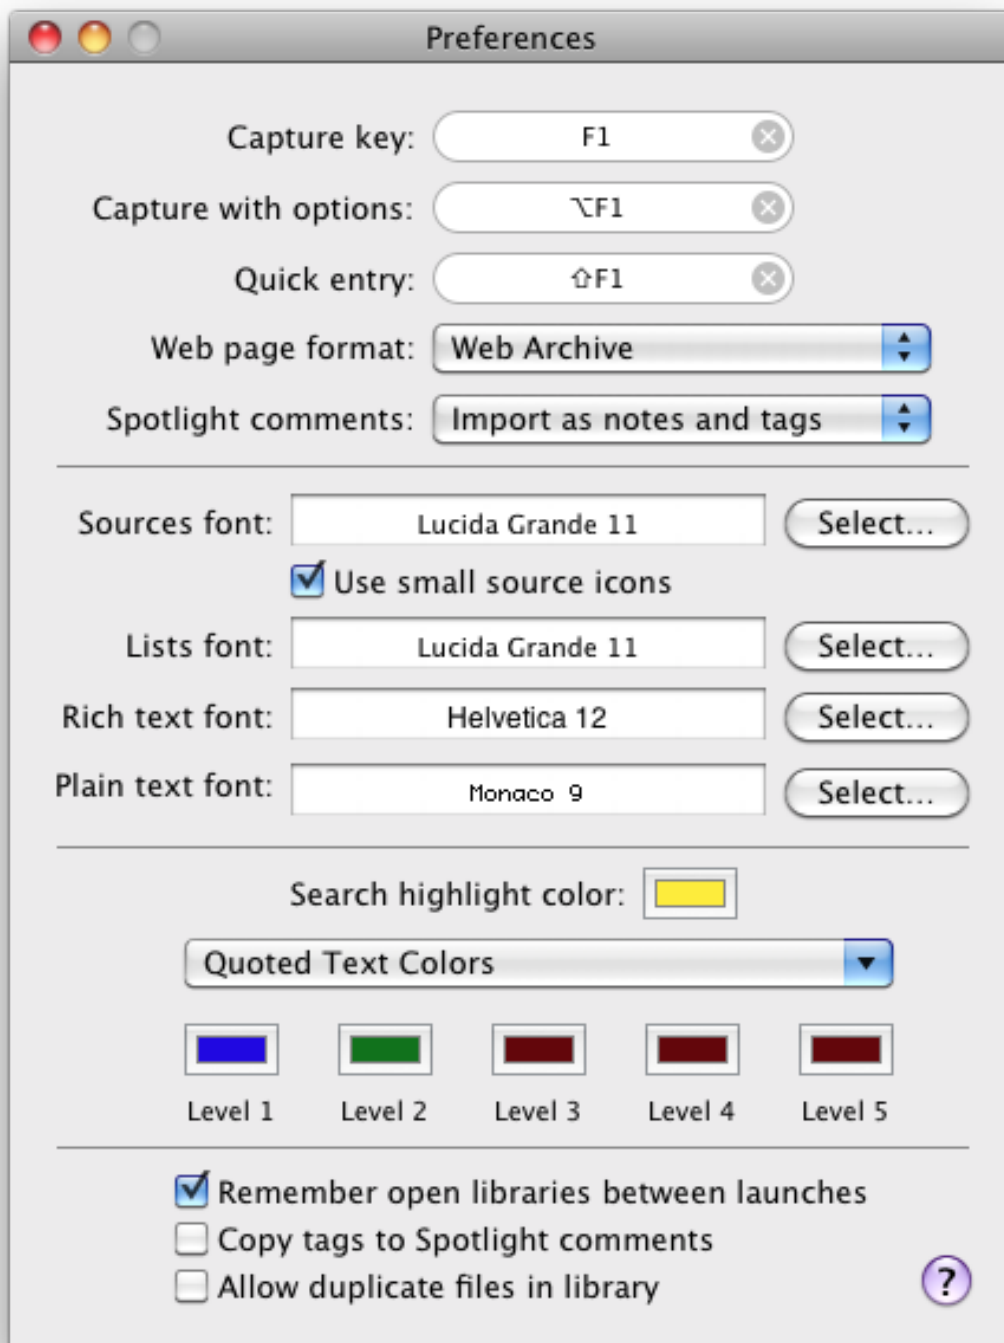

This menu provides access to the full EagleFiler documentation (in Apple Help or PDF format) as well as a link to the technical support Web site.

5.10 The Dock Menu

To access the Dock menu, right-click or hold down the Control key when clicking on EagleFiler's Dock icon.

The **Open Recent** commands let you access EagleFiler libraries that might not currently be open. The **Capture From <Application>** command is equivalent to pressing the [capture key](#). The **Import Clipboard** command will import any text on the clipboard as a new rich text file. The **New Record** commands let you create new files in the current library.

6 Preferences

6.1 Capture key

You can always import into EagleFiler using [Import URLs...](#), [Import Files...](#), or drag and drop. However, if you are already viewing the information that you want import, it's much easier to just press the capture key.

When you press the capture key, EagleFiler automatically determines what you're currently viewing (or what you have selected) and imports it into the current library. If no library is currently open, EagleFiler opens the [Capture with options](#) window so that you can pick a library.

There are many [applications that support capture](#). EagleFiler will play a camera sound, bounce its Dock icon once, and show a camera icon in its Dock tile to let you know that the capture has started. When it's finished, if you have [Growl](#)⁴⁰ installed, you'll see a notification bubble.

By default, the capture key is F1. If you have a notebook or an aluminum Apple keyboard, you'll need to hold the *fn* key to type F1 unless you've checked **Use all F1, F2, etc. keys as standard function keys** in the **Keyboard & Mouse** preferences pane or are using [FunctionFlip](#)⁴¹. (This setting is called **Use all F1, F2, etc. keys as standard function keys** in Mac OS X 10.4.) You can also change the capture key to a different key or key combination if you prefer.

If you'd rather import just the selected text instead of the entire Web page or document, you can use drag and drop or the **EagleFiler: Import** service (Command%) instead of the capture key.

EagleFiler must be running in order for the capture key to work. Thus, you may wish to add EagleFiler to your **Login Items** in the **Accounts** pane of System Preferences. You can easily do this by clicking on the EagleFiler icon in the Dock and choosing **Open at Login**.

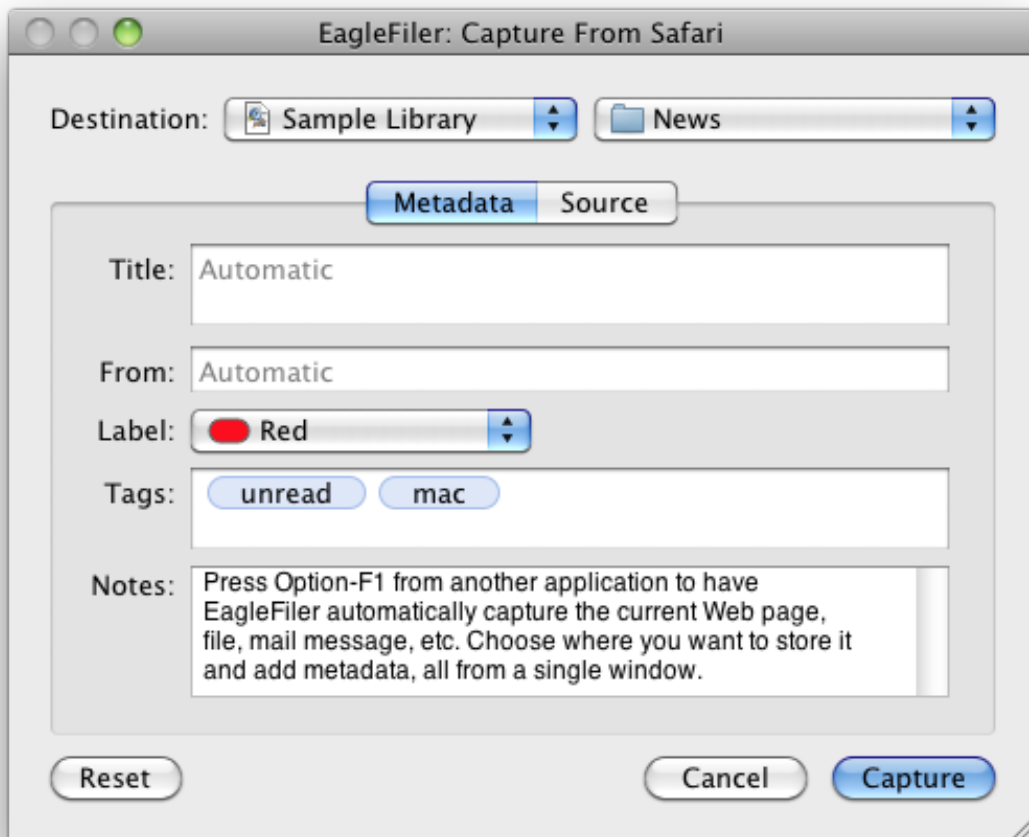

6.2 Capture with options

This works like the [capture key](#): you press it while in one of the [applications that support capture](#), and EagleFiler imports the "current item" into your library. The difference is that you can specify which library to import into, and which folder within that library. You can also set the title, from name, label, tags, and notes:

⁴⁰<http://growl.info>

⁴¹<http://kevingessner.com/software/functionflip/>

EagleFiler remembers this metadata (except the title) for each library, so it's easy to quickly capture a bunch of related items. Pressing the **Reset** button clears the metadata and sets the folder so that EagleFiler once again imports into the **Unfiled** source.

There are keyboard shortcuts for choosing the library (Command-1), folder (Command-2), **Label** (Command-3), **Reset** (Command-K), **Cancel** (Command- or Escape), and **Capture** (Enter). Once the folder menu is open, you can select a folder by typing the first few letters of its name.

6.3 Quick entry

Press this hotkey to bring up a dialog for creating a new file. You can enter the text content of the file and set the metadata (label, tags, notes, etc.). The **Format** pop-up menu lets you choose whether to create a **Rich text** (RTF or RTFD) or plain text (UTF-8) file.

Pressing the **R**eset button clears the metadata and sets the folder so that EagleFiler once again imports into the **U**nfiled source.

There are keyboard shortcuts for choosing the library (Command-1), folder (Command-2), **L**abel (Command-3), **R**eset (Command-K), **C**ancel (Command- or Escape), and **S**ave (Enter). Once the folder menu is open, you can select a folder by typing the first few letters of its name.

6.4 Web page format

When you import an entire Web page, EagleFiler can save it using the following formats:

Bookmark

A `.webloc` file that stores the URL and page title. This does not save the contents of the page, thus conserving disk space but restricting your search options. You can also edit (and update) the URL in a bookmark.

PDF

PDF files preserve the text, formatting, clickable links, and images. Web pages containing HTML frames cannot be saved as PDF files; when importing such pages, EagleFiler will save them as Web archives.

PDF (Single Page)

As above, except that the PDF is formatted as a single page and with tighter margins for easier on-screen viewing. For best results, set EagleFiler or your PDF viewer to display in “Single Page Continuous” mode. Printing PDFs in this format can be a problem, however, because the PDF page will generally be much larger than a sheet of paper.

Plain Text

Plain text files include the text content of the page, with no formatting or images. Thus, they make very efficient use of disk space.

Rich Text

RTF files preserve the text, formatting, and clickable links, but not the images.

Rich Text With Images

An RTFD package that preserves the text, formatting, clickable links, and images.

Web archive

Web archives preserve the entire page contents in its original format (HTML, CSS, images). They’re slower to display than PDFs, but you can resize the window to change the displayed width, and you can adjust the font size (often more useful than zooming a PDF). Web archives can be viewed on Macs (using Safari) and iPhones, but currently there are no Windows or Linux applications to display them.

You can use [bookmarklets](#)⁴² to temporarily override the format chosen in the preferences.

6.5 Spotlight comments

This setting controls what happens to a file’s Spotlight comments when you import it into EagleFiler.

Ignore

EagleFiler preserves the Spotlight comments.

Import as notes and tags

EagleFiler extracts tags (prefixed by & or marked using Punakea’s format) and assigns them as EagleFiler tags. It imports the remaining comments text as notes.

⁴²<http://c-command.com/eaglefiler/bookmarklets>

Import as tags

Each word in the comments is imported as a tag.

EagleFiler always imports tags that are stored in the file's extended attributes under `com.apple.metadata:kOMUser` by applications such as Tags, TagIt, and Default Folder X.

6.6 Fonts

Sources

Used in the [source list](#) in [browser windows](#).

Lists

Used in the records list in browser windows and in the list of tags in the tags inspector.

Rich text

Used for e-mail header information, HTML messages, and as the default font for notes.

Plain text

Used for plain text e-mail messages and text files.

The fonts for Web archives are mostly controlled by the Web archives themselves. The default font families and sizes can be controlled using Safari's preferences.

6.7 Search highlight color

This is the color that EagleFiler uses to emphasize the search terms in the records list and record viewer.

6.8 Quoted Text Colors

EagleFiler colors plain text e-mail messages according to the number of quote characters at the start of each line. The pop-down menu lets you choose a preset coloring scheme.

6.9 Remember open libraries between launches

If this is checked, EagleFiler will remember which libraries were open when you quit it, and it will re-open them the next time EagleFiler is launched.

In addition, you can put aliases to your favorite libraries in the folder:

/Users/<username>/Library/Application Support/EagleFiler/Startup Items

so that EagleFiler will always open them at launch. You can hold down the Shift key at launch to prevent it from re-opening the libraries or opening the startup items.

6.10 Copy tags to Spotlight comments

If this is checked, EagleFiler will set the Spotlight comments for each file to the names of the tags that it's been assigned. This enables you to search for a file using Spotlight by typing tag names as part of the query. Any existing comments will be lost. If this is not checked, EagleFiler will preserve the existing Spotlight comments when importing files.

EagleFiler will automatically copy the tags to the comments when a library is opened and periodically thereafter. You can force it to update the comments by using the [Backup Metadata](#) command.

There is an [esoteric preference](#) to control the tag prefix that's added to each tag name in the comments. The default prefix is “&”.

As of version 1.4.7, EagleFiler supports [OpenMeta](#)⁴³, which is much more efficient than Spotlight comments. Thus, the **Copy tags to Spotlight comments** option is no longer recommended except for use on Mac OS X 10.4 and for interoperability with non-OpenMeta applications.

6.11 Allow duplicate files in library

Normally EagleFiler will prevent you from importing a file if a file with the same contents (in the data fork) is already in the library. You can check this option if you prefer to import every file, even duplicates. In order for duplicate detection to work, your files' checksums must be up-to-date. For more information, please read about the [Verify](#) and [Update Checksum](#) commands.

Archived Web pages with the same source URL will generally contain different data, so EagleFiler will not treat them as duplicates. However, there is [a script](#)⁴⁴ for removing duplicates by URL if that's what you want to do.

6.12 Esoteric Preferences

You can set esoteric EagleFiler preferences by clicking the links on this page. Unlike with regular preferences, you must generally quit and re-launch EagleFiler in order for an esoteric preference to take effect.

⁴³<http://openmetainfo.org>

⁴⁴<http://c-command.com/scripts/eaglefiler/remove-duplicate-urls>

AutomaticallyBackupMetadata

EagleFiler [automatically backs up](#) your libraries' metadata (and, at the same time, copies tags to the Spotlight comments, if you've asked it to do that), but you can turn this feature [off](#) for a slight speed increase.

CalculateFolderSizes

This controls whether EagleFiler [calculates folder sizes](#) to display them in the records list. [Turning off](#) this feature will increase EagleFiler's responsiveness.

CaseSensitiveTagCompletion

Normally, tag auto-completion is [case-insensitive](#) so that you see as many matching tags as possible. You can also set it to be [case-sensitive](#) so that it is easier to type new tag names that are similar to existing tags but with differing case.

ClearSearchWhenChangingSources

Normally EagleFiler [preserves your search query](#) when you view different sources, so that you can easily search different folders without retyping it. You can optionally set EagleFiler to [clear the search](#) so that clicking on a different folder takes EagleFiler out of search mode and shows you all the records.

DefaultMessageEncoding

When a message doesn't specify which text encoding it uses, EagleFiler has to guess. An incorrect guess may cause the message to display using strange accents or garbage characters. By default EagleFiler guesses [MacRoman](#), but you can change it to guess [ISO Latin 1](#) instead.

EnableWebPlugIns

Normally, EagleFiler [will show](#) content from Web plug-ins (such as Flash) when displaying an HTML file or Web archive. However, you can also [disable plug-ins](#) if you don't want to see this content.

ExcludeIndexesFromBackup

EagleFiler's index files are normally [included in Time Machine backups](#). This way, you can immediately search your library after restoring it from backup. To save space on the backup device and speed up your backups, you can set EagleFiler to [exclude the indexes from backups](#). The downside to this is that, as with Spotlight, you'll have to wait for the files to be re-indexed after restoring.

FindPanelDiacriticInsensitive

EagleFiler's **Find** panel normally works [like TextEdit's](#). Searching for "e" does not find "é". You can also make EagleFiler's **Find** panel [diacritic-insensitive](#) so that "e" matches "é", "ü" matches "u", etc., as always happens with EagleFiler's library search and Spotlight. This feature does not work in Web or PDF views, and it requires Mac OS X 10.5 or later.

FolderMailboxTitleSeparateFromFilename

Normally EagleFiler will keep the titles of folders and mailboxes [in sync](#) with their filenames. You can also set it to allow the titles to be [distinct](#) from the filenames. This is potentially

useful if you need to manage a folder structure using fixed filenames but you want to have longer, more descriptive titles in EagleFiler.

HighlightSearchMatches

Normally EagleFiler will [highlight in the record viewer](#) the words that match your search query. [Disabling this feature](#) will provide a speed increase.

ImportSpotlightKeywords

EagleFiler normally [ignores Spotlight keywords](#) when importing files to avoid cluttering your tags list with irrelevant or incorrect entries. You can also set EagleFiler to [import Spotlight keywords as tags](#) if you generally like the keywords that are assigned to your files.

ImportTextAsWebArchive

When importing the selected text from a Web view (via drag and drop, the **Service** menu, or the **Import Clipboard** command), EagleFiler normally uses the [Web archive format](#), as this preserves all of the original information. You can instead set it to import in [RTF\(D\) format](#) for easier editing.

InvisibleMetadataFiles

This controls whether EagleFiler `Metadata.plist` files are [visible](#) or [invisible](#).

MarkNewRecordsAsUnread

Normally EagleFiler will [mark newly imported records as unread](#), but you can also tell it to [leave them untagged](#). This does not affect the **Capture With Options** window, since that always suggests the tags from the previous capture.

MaxEditableTextFileSizeInMB

Normally EagleFiler will [display the entire contents](#) of a text file, even if it's many megabytes. This can take a long time, especially when using Mac OS X 10.4. You can speed it up by setting EagleFiler to [only show the first 10 MB](#) of a text file.

MediaStyle

If a Web page includes multiple stylesheets, you can choose whether EagleFiler displays it using the [print stylesheet](#) or the [default stylesheet](#).

OldApplicationIcon

If you prefer, you can use the [old application icon](#) from EagleFiler 1.0 through 1.4 rather than the [new photo-realistic](#) one.

OpenEagleFilerURLsInNewWindow

Normally EagleFiler opens `x-eaglefiler` URLs in a [an existing browser window](#). You can also set it to [create a new browser window](#).

PlayCaptureSound

When you press the capture key, EagleFiler can either [play a sound](#) or [be silent](#).

RecordsListHasAlternatingBackground

This controls whether EagleFiler uses a [solid white background](#) or [blue-and-white](#) alternating row background colors in the records list.

ScanForNewFilesOnOpen

EagleFiler normally scans for new files [when the library is opened](#). You can [turn this off](#) so that it only scans for new files when you use the menu command.

SendsWholeSearchString

Normally EagleFiler updates the search results [as you type](#). If you are a slow typer, it may do this after each letter, causing the search to take a long time. You can instead set EagleFiler to only do the search once, [when you press Return](#).

ShowImagesInMessages

Normally EagleFiler will [show images in HTML e-mails](#), but you can also tell it to [not load them](#) if you're concerned about Web bugs.

TagCommentPrefix

If a record is tagged *unread* and *flagged* EagleFiler will normally set the Spotlight comments to `&flagged &unread`. This allows for integration with other applications that follow this convention, and it lets you use Spotlight to search for files with particular tags. You can set it to use [no prefix](#) so that it instead sets the comments to `flagged unread` or [set the prefix to "&"](#) or go back to the default.

ViewEMLOnTiger

When you double-click an e-mail message to open it in a mail program, EagleFiler normally saves it in `.eml` format on Mac OS 10.5 or later and in `.emlx` format on Mac OS X 10.4. This is so that the messages will be [openable by Apple Mail on Mac OS X 10.4](#). You can instead make them [openable by Microsoft Entourage](#).

7 Frequently Asked Questions

7.1 Why doesn't my serial number work?

You need to enter the *serial name* and *serial number* exactly as they appear on your order confirmation e-mail. If you no longer have this e-mail, you can look up the name and number. Launch EagleFiler and choose **Purchase** from the **EagleFiler** menu. Then click the **Look Up My Serial Number** button.

7.2 How can I move messages between mailboxes?

In order to improve performance and make more efficient use of disk space, EagleFiler prefers to store e-mail messages in mailbox files (using the standard “mbox” format), and it does not allow them to be moved from one mailbox to another. Thus, it is best to organize messages into the mailboxes that you want (and to delete messages that you don’t want to save) *before* importing them into EagleFiler. Nevertheless, several organization options are available once your messages are in an EagleFiler library:

1. You can [merge multiple mailboxes](#) into one. For example, if each month you import mailbox **A** into EagleFiler, you’ll end up with lots of **A** mailboxes in the library, each containing one month’s worth of messages. By merging all of the **A** mailboxes into one, you can reduce visual clutter and make EagleFiler run more efficiently.
2. You can drag messages from mailboxes to folders. This deletes the messages from the mailbox and stores the messages as individual `.eml` files in the folder. This is not as efficient as storing one file per mailbox, but it allows for more flexible organization.
3. You can organize messages (from different mailboxes) into [tag sources](#). As with playlists in iTunes, each message can be in more than one tag source at a time.
4. The easiest way to avoid storing duplicate messages is to delete messages in your mail program after you’ve imported them into EagleFiler. You can also delete individual messages from an EagleFiler mailbox, although this will not save disk space; it will only hide the messages from view.

7.3 How can I access my library from multiple Macs?

There are several different ways of sharing an EagleFiler library among multiple Macs. The general guideline is that you should only open the library in one copy of EagleFiler at a time, although you can access the individual files (and add new files) from multiple computers simultaneously. Most of these techniques will also work for sharing your files with a Windows PC or iPhone OS device. For more information, please see the [How can I put my library on my iPhone?](#) page.

Portable Drives

EagleFiler [library folders](#) can be stored wherever you want. You can take a library with you by keeping it on a USB keychain drive, iPhone, iPad, iPod, or external hard drive.

Dropbox

[Dropbox](#)⁴⁵ is a free service for sharing files between Macs and accessing them from the Web or an iPhone or iPad. It’s somewhat like an iDisk, but much faster. After editing your library with one Mac, make sure that both it and the second Mac have fully synced with the Dropbox

⁴⁵<http://www.dropbox.com>

server (that is, the icon in the menubar no longer shows spinning arrows) before opening the library on the second Mac. To make sure that your files' metadata⁴⁶ is synced, use [Dropbox 0.8 or later](#)⁴⁷. File labels will not be synced with Dropbox unless you use an encrypted library (see below).

iDisk

Another option is to store the library on your iDisk⁴⁸. To do this, first go to the **iDisk** tab of the **MobileMe/.Mac** pane of **System Preferences**. Click **Start** to turn on iDisk syncing and make sure that it's set to **Manually**.

Create a new EagleFiler library and save it on the iDisk. For greater speed, behind the scenes your Mac will store a copy of the library on your hard disk for EagleFiler to work with, and it will synchronize this with your iDisk. When you're finished using the library for a while,

⁴⁶<http://forums.dropbox.com/topic.php?id=17226&replies=188>

⁴⁷<http://forums.dropbox.com/tags.php?tag=beta>

⁴⁸<http://www.apple.com/mobileme/features/idisk.html>

close it in EagleFiler. If the library is encrypted, eject it. Then click the sync button next to your iDisk in the Finder's source list:

To access the library on another Mac, click the sync button and then open the library in EagleFiler. When you're finished, close the library and click the sync button again. In this way, multiple Macs can share the same EagleFiler library. Just remember to always sync before opening the library and after closing it, and only access the library from one Mac at a time.

Note: Apple's iDisk syncing does not preserve your file's creation dates or Finder labels; if those are important to you, you should use an encrypted library (see below).

SugarSync and Dropbox Prior to 0.8

[SugarSync](http://www.sugarsync.com)⁴⁹ is a free service for sharing files between Macs and accessing them from the Web or an iPhone or iPad. After editing your library with one Mac, make sure that both it and the second Mac have fully synced with the server before opening the library on the second Mac.

Note: SugarSync and [Dropbox](http://www.dropbox.com)⁵⁰ prior to version 0.8 currently have limited support for Mac files. They **do not support**⁵¹ resource forks, extended attributes, bundle bits, or other HFS metadata. SugarSync does not support filenames containing `:` at the Unix level (`/` in the Finder). EagleFiler does not require support for this metadata. However, you should be aware that if you set file labels or custom icons, these will be lost when syncing with Dropbox or SugarSync. Additionally, if you use EagleFiler to organize files that contain resource forks (such as some sound or font files, old NisusWriter files, etc.) they will become unusable after syncing. If you have detailed knowledge of what kind of metadata your files have, and whether it needs to be preserved, you can decide for yourself whether or not this is a problem for you. If in doubt, you should use an encrypted library (see below).

Encrypted Libraries

If you use the `New Library...` command create an encrypted EagleFiler library, EagleFiler will wrap up your library and all its files into a disk image that preserves all the metadata. Be sure to eject the disk image after closing the library in EagleFiler. This causes the OS to save all the information to disk so that it can be synced properly.

Note: Encrypted libraries can only be accessed from a Mac, not from the Web or an iPhone or iPad.

Note: The more efficient *sparse bundle disk image* is recommended, although prior to Mac OS X 10.6 Dropbox only works with the *sparse disk image* format.

⁴⁹<http://www.sugarsync.com>

⁵⁰<http://www.dropbox.com>

⁵¹<http://support.sugarsync.com/ics/support/default.asp?deptID=4579&task=knowledge&questionID=361>

File and Web Sharing

Mac OS X's built-in file sharing and Web sharing can be used to make your library available on other Macs. Just make sure that the [library folder](#) is stored in a folder that's set up for file sharing (e.g. **Public**) or Web sharing (e.g. **Sites**) and that sharing is enabled in System Preferences.

Note: Accessing a library over the network via file sharing is generally slower than using an Dropbox, iDisk, or SugarSync.

7.4 How can I put my library on my iPhone?

EagleFiler stores your files in standard formats, and the iPhone OS can read most of them. There are several different ways to store your library so that it can be shared between a Mac, iPhone, iPad, and iPod touch.

Cloud Storage and Provider

You can store your EagleFiler library on your Mac, sync it with the cloud, and then access it from one of these apps:

- [Dropbox](#)⁵². Recommended. The syncing is simple and fast. Free for up to 2 GB. Please see the [notes](#) about using Dropbox with EagleFiler.
- [MobileMe iDisk](#)⁵³. Apple's solution requires a [MobileMe account](#)⁵⁴, and the syncing is slower than with Dropbox. Be sure to [turn on iDisk syncing](#).
- [SugarSync](#) is a cloud service that's similar to Dropbox but with [a few drawbacks](#).

Cloud Storage Access

These apps let you access cloud storage from another provider such as Dropbox or MobileMe:

- [Quickoffice Connect Mobile Suite](#)⁵⁵. Supports editing of Microsoft Word and Excel files.
- [Office2](#)⁵⁶ and [Office2 HD](#)⁵⁷. Supports editing of Microsoft Word and Excel files.
- [Droptext](#)⁵⁸ supports editing text files on Dropbox.
- [Elements](#)⁵⁹ supports editing text files on Dropbox, with Markdown and TextExpander touch support.

⁵²<http://www.dropbox.com/iphoneapp>

- [Mobile Disk](#)⁶⁵
- [MobileFiles](#)⁶⁶
- [OneDisk](#)⁶⁷
- [Quickword](#)⁶⁸

Device Storage

You can store your EagleFiler library on an iPhone and share it with your Mac (via Wi-Fi) using one of these apps:

- [Air Sharing](#)⁶⁹, [Air Sharing Pro](#)⁷⁰, and [Air Sharing HD](#)⁷¹. Recommended. Great interface, and EagleFiler can directly work with libraries that are stored on the device.
- [Good Reader](#)⁷² Recommended. Nice PDF reader, and EagleFiler can directly work with libraries that are stored on the device.
- [Quickword](#)⁷³ Recommended. Supports editing of plain text and Microsoft Word files.
- [ReaddleDocs](#)⁷⁴ and [ReaddleDocs for iPad](#)⁷⁵
- [DataCase](#)⁷⁶
- [Files](#)⁷⁷
- [FileMagnet](#)⁷⁸
- [MobileStudio](#)⁷⁹

Other

- [SyncBook](#)⁸⁰ is a pair of Mac and iPhone apps for viewing and editing notes. It can integrate with EagleFiler [via a symlink](#)⁸¹.

7.5 How can I encrypt my files?

EagleFiler supports encryption at the library level. You can have multiple libraries, each of which is either encrypted or not encrypted. An encrypted library works just like a normal library except that all aspects of it (the files, notes, metadata, search indexes, and temporary files) are unreadable until the proper passphrase has been entered.

When creating a [New Library...](#), the **Encrypt library using passphrase** option lets you store the library on an encrypted disk image. The entire library (including all the files, notes, and indexes) will be stored in a disk image file that is encrypted using [AES-128 or AES-256](#)⁸². To access the library, double-click the disk image file and enter the library's passphrase. The library will appear as a white icon on your desktop, and you can double-click the `.eflibrary` file to open it in EagleFiler. (You can also access all the files in the library directly from the Finder.) When you're done with the library, close it in EagleFiler and eject the library from your desktop to lock it again. Now it can only be accessed by people who know the passphrase.

On Mac OS X 10.4, EagleFiler always creates a sparse disk image file using AES-128 encryption. On Mac OS X 10.5, you can choose the format and encryption level of the disk image:

Sparse Disk Image

Creates a `.sparseimage` file that's compatible with Mac OS X 10.4 and later.

Sparse Bundle Disk Image

Creates a `.sparsebundle` package that requires Mac OS X 10.5 or later, but which is much more efficient for backups.

128-bit AES Encryption

Compatible with Mac OS X 10.4 or later. The U.S. National Security Agency (NSA) has announced that it may be used for SECRET level documents.

256-bit AES Encryption

Requires Mac OS X 10.5 or later. It is slower but even more secure than AES-128. The NSA has announced that it may be used for TOP SECRET level documents.

You can quickly access an encrypted library by creating an alias of its `.eflibrary` file. When you double-click the alias, the Finder will ask for the passphrase and then open the library with EagleFiler.

An encrypted library will only consume the amount of disk space needed to hold its files, indexes, and temporary files. However, you must set a maximum library size that controls how large the library can grow. The larger the maximum size, the more overhead there is for encryption. For example, a library with a 1 GB maximum size will have about 26 MB of overhead, while a library with 500 GB maximum size will have about 111 MB of overhead. If your library reaches the

⁸²http://en.wikipedia.org/wiki/Advanced_Encryption_Standard#Security_of_AES

maximum size, you can create a new, larger library and copy all of the files to it by dragging the **Records** source from the old library to the new one.

To change the passphrase of an encrypted library, eject the library, then open Disk Utility. Drag the library's disk image file into Disk Utility's device list, at the left of the window. Select the disk image in the list and choose **Images** ▸ **Change Password**.

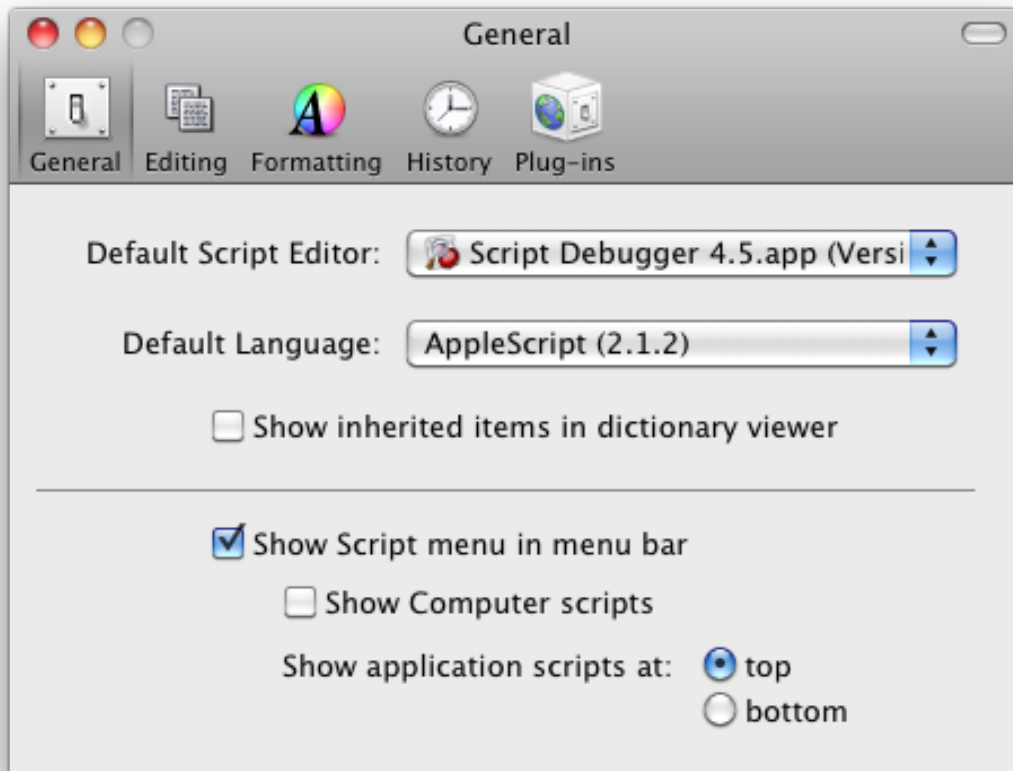

Note: Mac OS X does not support sparse bundle disk images on certain volume types, so in those cases you would need to use a sparse disk image even if you have a recent version of Mac OS X.

7.6 How can I run AppleScripts from EagleFiler's script menu?

EagleFiler has extensive support for AppleScript so that you can automate it and integrate it with other applications. The [EagleFiler AppleScripts](#)⁸³ page has a collection of sample scripts that are useful in their own right and that can also be used as templates for developing your own scripts.

By using Mac OS X's script menu, you can make AppleScripts available from inside EagleFiler as if they were built-in commands. To enable the script menu, open the AppleScript Editor application in the **Utilities** folder. In the preferences window, make sure that **Show Script menu in menu bar** is checked.

⁸³<http://c-command.com/scripts/eaglefiler/>

The menu will appear at the right side of your menu bar, near the clock. To add commands to the menu, switch to EagleFiler and choose **Open Scripts Folder** ▸ **Open EagleFiler Scripts Folder**. This will open a special folder in the Finder; every script file that you put in this folder will show up in EagleFiler's script menu.

To run a script, just select the menu command with your mouse. If you need additional script menu features such as keyboard shortcuts, try Red Sweater Software's [FastScripts](#)⁸⁴.

For more information about AppleScript, see Apple's [AppleScript Language Guide](#)⁸⁵, [AppleScript: The Definitive Guide](#)⁸⁶ by Matt Neuburg, or [AppleScript 1-2-3](#)⁸⁷ by Sal Soghoian and Bill Cheeseman.

7.7 How can I run optical character recognition (OCR) on my PDFs?

If you're trying to run a paperless office, the first step is getting your papers scanned into your Mac. We recommend [Fujitsu ScanSnap](#)⁸⁸ scanners as the easiest way to create a multi-page PDF from a stack of papers.

⁸⁴<http://www.red-sweater.com/fastscripts/>

⁸⁵<http://developer.apple.com/library/mac/#documentation/AppleScript/Conceptual/AppleScriptLangGuide/introduction/>

⁸⁶<http://oreilly.com/catalog/9780596102111>

⁸⁷<http://www.peachpit.com/store/product.aspx?isbn=0321149319>

⁸⁸<http://www.fujitsu.com/us/services/computing/peripherals/scanners/scansnap/scansnap-s1500m.html>

The second (optional) step is to use [optical character recognition \(OCR\)](#)⁸⁹ to make the text in the scanned PDFs searchable and selectable. The easiest way to do this is to use Smile Software's [PDFpen](#)⁹⁰ to add a text layer to your PDF. You can do this directly in PDFpen, but it's easier to automate the process via AppleScript. To do this, download the [OCR With PDFpen](#)⁹¹ script in compiled format. There are several ways you can use this script:

EagleFiler's script menu

Follow the instructions on the [How can I run AppleScripts from EagleFiler's script menu?](#) page, then save the script file into the folder to add the **OCR With PDFpen** command to the script menu. Then you can simply select PDF files in EagleFiler and choose **OCR With PDFpen**.

Drag and drop

Use AppleScript Editor to save the script as an application. Then drag and drop PDF files onto it to OCR them and then import them into EagleFiler.

Direct from ScanSnap

Save the script as an application and set it as the target of your scanner's software. For example, go to the **Application** tab of the ScanSnap Manager's settings, click **Add or Remove**, and choose the script application.

Folder action

Attach the script to a folder as a folder action and save files into that folder.

7.8 How can I copy my tags to another library?

Once you've created some tags and set them up the way you want, it's easy to use them in another library. Assign the tags to a file, and then drag it into the other library. EagleFiler will transfer the tags (along with their abbreviations, colors, and hierarchy) to the other library. This is really just a special case of a general EagleFiler feature that metadata (tags, notes, titles, etc.) are preserved when copying files between libraries.

7.9 How can I speed up EagleFiler?

Getting a faster Mac, a faster hard disk, or more RAM would of course make everything faster, but there are also some less expensive ways to speed up EagleFiler:

1. EagleFiler is designed to perform best when it is kept running, with a library open. It will be faster to leave it running (perhaps hidden) in the background than to open and

⁸⁹http://en.wikipedia.org/wiki/Optical_character_recognition

⁹⁰<http://www.smilesoftware.com/PDFpen/>

⁹¹<http://c-command.com/scripts/eaglefiler/ocr-with-pdfpen>

close it each time you add a file to the library. You can easily hide EagleFiler by holding down the Option key as you click to switch to another application. Additionally, leaving EagleFiler running will allow you to use its [capture key](#).

2. If you just want to add a file to a library, without waiting to open the library or EagleFiler, you can save the file in the library's **To Import** folder so that it will be imported the next time EagleFiler opens that library.
3. EagleFiler is designed to support multi-gigabyte libraries with many thousands of files. However, as with all software, viewing a library (or folder) with fewer files in it will generally be faster than viewing one with many. (The sizes of the files don't have much effect on EagleFiler's performance.) EagleFiler lets you create multiple libraries, so one way to increase performance is to use several smaller libraries instead of one huge one. This can also provide an additional level of organization.
4. Fewer large mailboxes are faster than many small ones. You can combine multiple mailboxes using the [Merge Mailboxes](#) command.
5. Emptying EagleFiler's trash will reduce the number of records in the library, and thus speed it up.
6. Importing files is faster when nothing is selected in the [source list](#) and the [Activity](#) window is closed.
7. In order to enable quick searching, EagleFiler maintains indexes of all the files and e-mail messages in a library. By default, EagleFiler indexes for [phrase searches](#). This allows the most flexible searching, but indexing can take a lot of time and disk space. If you don't need to do phrase searches, you can [rebuild](#) the indexes for word searching. This will reduce the size of the indexes and speed up indexing going forward.
8. Viewing search results in large documents will be faster if you turn off [search match highlighting](#).
9. When EagleFiler [opens a library](#), it checks to make sure all of the files are present, [backs up the metadata](#), and [copies the tags to the Spotlight comments](#). You can hold down the Shift key when opening the library to skip these steps, or click the × buttons in the [Activity](#) window to cancel them.
10. Displaying and scrolling the [records list](#) will be faster if you tell EagleFiler not to [calculate folder sizes](#).
11. Viewing large text files will be faster if you use Mac OS X 10.5 instead of 10.4 or if you set EagleFiler to [only show the first few MB](#) of large files.
12. Opening a library will be faster if the selected source (when you closed the library) does not contain many files. For example, if you had **Records** selected, and it was sorted by modification date, EagleFiler would have to load all the files (and possibly all the e-mail messages) and look up their modification dates. If a subfolder (or no source at all) were selected, the library would open more quickly because EagleFiler would initially only have to load the contents of that folder.

13. When creating a smart folder, put the most restrictive criteria higher in the list. Use the **Search inside** pop-up menu and checkboxes to restrict the search as much as possible.
14. Leave e-mail messages in their mailboxes rather than dragging them out into folders (which converts them to individual files).
15. Searching is faster if you tell EagleFiler to search for whole words rather than partial words.

7.10 Why does EagleFiler import the wrong Web page when I press the capture key?

Some Web pages—such as order confirmations and credit card statements—cannot be loaded by URL (even though EagleFiler uses Safari’s persistent cookies). These pages require session state, e.g. entering a password, logging in, and then clicking a link to get to the page. When you try to capture one of these pages, EagleFiler will import the site’s login page, since that’s what the server produces when EagleFiler requests the URL. (An easy way to see that this has happened is to install [Growl](http://growl.info)⁹²; EagleFiler will then show a thumbnail preview of each Web page that you capture, so you can see whether it looks right.)

Two ways to import these types of pages are:

- Choose **File** > **Print** in your browser and then choose **Save PDF to EagleFiler** from the **PDF** button menu.
- Choose **File** > **Save** in your browser and save the page into EagleFiler’s **To Import** folder.

8 Legal Stuff

Distribution

Please distribute the unmodified `EagleFiler-1.5.dmg` file on the Web, LANs, compilation CD-ROMs, etc. You may not charge for it (beyond a reasonable cost for media) or distribute the contents of the disk image file in isolation. You may not distribute your serial number.

Limited Warranty

The software is provided “as is,” without warranty of any kind, express or implied, including but not limited to the warranties of merchantability, fitness for a particular purpose and noninfringement. In no event shall the authors or copyright holders be liable for any claim, damages or other liability, whether in an action of contract, tort or otherwise, arising from, out of or in connection with the software or the use or other dealings in the software.

⁹²<http://growl.info>

License

A license for EagleFiler is good for one person *or* one computer. You may install it on one Mac, and everyone sharing that Mac may use it (on that Mac). Alternatively, you may install it and use it on multiple Macs (e.g. your desktop Mac and your laptop); then you (and no one else) may use it on any of those Macs. For multiple users on multiple Macs, you should purchase multiple licenses.

Copyright and Trademarks

EagleFiler and this manual are copyright © 2002–2010 by [C-Command Software](#)⁹³. All rights reserved.

9 Version History

1.5—November 22, 2010

Highlights

- The new [Quick entry](#) hotkey lets you create a new RTF or text file from within any application. You can enter the contents of the file, choose which library and folder it’s saved in, and set metadata such as the tags, label, and notes.
- When importing via drag and drop or **Save PDF to EagleFiler**, you can now hold down the Option key to have EagleFiler show the options dialog (which was previously only available when capturing). This lets you set the destination folder, tags, label, notes, etc. There is also a new **EagleFiler: Import (Ask for Options)** system service, which presents the options dialog when importing the selected text or file from another application, and the options dialog is also available for bookmarklets.
- You can now perform quick tag “searches” by selecting multiple sources (folders, smart folders, mailboxes, tags) at once (holding down the Command key). Previously, EagleFiler displayed the union of all the records in the selected sources. Now it displays the union of the records, but only those that have *all* of the selected tags. This makes it possible to easily winnow records by tag without typing a search query. For example, to see the flagged files in a folder, select the folder and the **flagged**

¹⁰⁸<http://www.apache.org/>

tag. To see the records that are both flagged and unread, select both the **flagged** and **unread** tags.

- The main window now displays much better previews for iWork documents than what Quick Look provides. For Keynote, Numbers, and Pages documents that were saved with an embedded preview, EagleFiler can now display full-size previews with multiple pages and highlighted search result text. This also works for OmniGraffle documents, and it works on Mac OS X 10.4 (where Quick Look is not available).
- Double-clicking a folder or mailbox in the records list now opens it in the same window rather than making a new window. This should make browsing faster. If you do want a new window, you can Option-double-click or use the [Open in New Window](#) command.
- There's a new [Move To](#) command in the **Record** menu and the contextual menu, which lets you quickly move records to a different folder.
- You can now add files directly to EagleFiler's library folder (or a subfolder) in the Finder. When EagleFiler scans for new files (which it does when you open the library or use the [Scan for New Files](#) command), it will automatically import any files that it did not previously know about. You can turn off the [ScanForNewFilesOnOpen esoteric preference](#) if you don't want EagleFiler to automatically scan when the library is opened.
- EagleFiler can now index and search files that are attached to e-mail messages. This includes text, RTF, PDF, and Word files, as well as file types that have Spotlight importers.
- Smart folders that search for "contains any/all tags" are about 10 times faster than in EagleFiler 1.4.
- There's a new [Web page format](#) called **PDF (Single Page)**, which creates PDF files that are optimized for on-screen viewing in a single, continuous page.
- Added the [OCR With PDFpen](#)¹⁰⁹ and [OCR using UNPDF](#)¹¹⁰ scripts, which let you perform optical character recognition on PDF files in EagleFiler. For more information, see the [How can I run optical character recognition \(OCR\) on my PDFs?](#) section.
- The tags bar can now be used to assign (or remove) tags from multiple selected records at once. This also works in the **Info** inspector. (If the records have differing tags, EagleFiler shows the **Batch Change...** button, as before.)
- Add the [Close & Lock](#) command, which closes an encrypted library and also locks it (by ejecting the disk image) so that accessing library's contents requires the passphrase.

Source List

- [The Go menu](#) contains new commands to quickly jump to **Records** (to search the whole library), the built-in smart folders, **flagged**, and **unread**, along with some commands that were previously in the [the View menu](#).
- You can now use [Copy Record Link](#) to create URLs that, when clicked, select particular folders, smart folders, or tags in the source list.

¹⁰⁹<http://c-command.com/scripts/eaglefiler/ocr-with-pdfpen>

¹¹⁰<http://c-command.com/scripts/eaglefiler/ocr-with-unpdf>

- Choosing **Select All** while the source list has focus now selects all the records, which is more useful than the previous behavior of selecting all the sources.

Records List

- The new **Open With** submenu lets you view a file or mail message using a particular application rather than the default. You can use **Always Open With** to change the default application that's used when you double-click.
- The **New Record > From Clipboard** command lets you create new files in EagleFiler by “pasting” (the shortcut is Command-Shift-V) text snippets into the records list.
- You can now drag and drop onto individual folders in the records list. This works for importing files from other applications, moving records within a library, and copying files from other EagleFiler libraries.
- You can now three-finger swipe left or right on a multi-touch trackpad or Magic Mouse to go to the previous or next record in the list.
- There are new columns for Notes, Source URL, flagged, and unread.
- Tooltips now show more information: the kind, size, relative path, source URL, tags, and notes.
- The icon column now has a title in the hiding/showing menu.

Mail

- The new **Merge Message Files** command lets you recombine e-mail messages stored as individual `.eml` files into a single mailbox file. This lets EagleFiler store the messages more efficiently and allows for interoperation with other applications that can read mbox files.
- When importing a `.eml` file, EagleFiler now changes the file's dates to match those of the contained e-mail message.
- Apple Mail is pickier than it used to be about which mbox files it will import. When importing and exporting messages, EagleFiler is now more aggressive about normalizing the message formats so that Apple Mail will accept them.
- EagleFiler can now import mailboxes that were exported by Apple Mail's **Archive Mailbox...** command. However, it's still best to capture the messages directly from Mail. The archive mailboxes use a non-standard mbox format, and EagleFiler cannot read the message status flags or MailTags metadata from them.
- When merging mailboxes, the date added is now set to that of the newest mailbox instead of the current date.
- When converting e-mail messages to `.eml` format, EagleFiler now exports the tags to OpenMeta.
- If you've set Entourage or another mail program as the default opener for `.eml` files (rather than Apple Mail), EagleFiler now shows the appropriate application name and icon in the **Record** menu when an e-mail message is selected.
- EagleFiler can now import `.rssmbox` folders from Apple Mail. Capturing RSS messages from Mail does not work, however, due to limitations of Mail's AppleScript support.

Viewing and Editing

- You can now open the [Quick Look](#) window by pressing the Spacebar or clicking a toolbar button.
- The new [Slideshow](#) command (and toolbar button) opens a full-screen Quick Look view of the selected record or records.
- Added **Replace**, **Replace All**, and **Replace and Find** commands to the **Edit** ▸ **Find** menu. The menu commands are probably less convenient than opening the **Find** panel, however you can use System Preferences to assign them keyboard shortcuts, to make text editing much faster.
- Added to the **Edit** ▸ **Spelling and Grammar** menu: **Check Grammar With Spelling** and **Correct Spelling Automatically**. EagleFiler remembers these settings per-window.
- Added commands in the **Edit** ▸ **Transformations** submenu: **Make Upper Case**, **Make Lower Case**, and **Capitalize**.
- Added options in the **Edit** ▸ **Substitutions** menu: **Show Substitutions**, **Smart Copy/Paste**, **Smart Quotes**, **Smart Dashes**, **Smart Links**, **Data Detectors**, and **Text Replacement**. EagleFiler enables these features by default when editing, and it remembers per-window how you've configured them.
- Added the **Strikethrough** command to the **Format** menu.
- Improved the quality of the thumbnail images when EagleFiler displays a record in the inline viewer using Quick Look.

Searching

- Added a Spotlight importer plug-in so that the contents of `.eml` files (messages that you've dragged out of their mailboxes into folders) can be searched outside of EagleFiler.
- Indexed searches can now find text from additional e-mail header fields such as Bcc and various sender and mailing list fields. This change takes effect for newly imported mail, or if you hold down the Command and Option keys when opening a library and tell EagleFiler to rebuild its indexes.
- Added label text to the smart folder editor that explains how to create new Any/All/None criteria.
- Note files are now given the associated record's tags so that they can be searched by tag via Spotlight.
- EagleFiler is now able to search invisible content in Web archives: link titles, image alt text, and hidden elements (e.g. spoiler text). Previously imported Web archives will be reindexed the next time you open the library.
- EagleFiler is much faster at indexing Web archives.

Capture

- When capturing a Web page from Safari, EagleFiler now stores the selected text in a note.
- EagleFiler can now capture from Google Chrome, DEVONthink Pro 2, and Microsoft Outlook 2011.
- When capturing from Journler, EagleFiler now preserves the category (as an EagleFiler tag) and assigns tags to any subsidiary resource files that it imports (rather than just to the main file).

- EagleFiler now plays the capture sound after running the script, rather than before, so you can use the sound as an indicator that it's OK to close your Safari window or NetNewsWire tab.
- The source items for a capture are now displayed on a separate tab, since they usually didn't fit in the single-line text field.
- Improved the error reporting when capturing from Entourage Firefox 3.6.
- Added the `PlayCaptureSound` [esoteric preference](#) so that it is now possible to make EagleFiler silent when you press the [capture key](#).

Documentation

- Added the [How can I run AppleScripts from EagleFiler's script menu?](#) and [How can I run optical character recognition \(OCR\) on my PDFs?](#) sections to the manual.
- If you're launching EagleFiler for the first time or it looks like you don't have any libraries, EagleFiler will open the (revised) [Basics](#) section of the manual to help you get started.
- Added an **About Stationery and Scripts** item to the **New Record** submenu to make it easy to open the relevant documentation.
- Updated the [How can I put my library on my iPhone?](#) and [How can I access my library from multiple Macs?](#) sections of the manual with additional information about Dropbox and other sharing software.
- Updated the [Importing Mail](#) section of the manual with instructions for importing IMAP mail from Postbox and Thunderbird.
- Added a [warning](#) that SugarSync does not support filenames containing `:` at the Unix level (`/` in the Finder).
- Added commands to the **Help** menu for displaying the keyboard shortcuts, example AppleScripts, and opening the bookmarklets information page.

AppleScript

- You can now get the viewer's selected text via AppleScript.
- Added the `asking for options` argument for the `import` script command so that you can show EagleFiler's options dialog when importing.
- It is now easier to set the source URL when importing via AppleScript.
- Added the `basename` property for records, which should simplify many common AppleScripts.
- Added the `text content` property for records, which is useful in circumstances where AppleScript's `contents` doesn't work.
- You can now initiate a capture or capture with options via AppleScript.
- Changing the source URL of a bookmark via AppleScript now writes the new URL into the bookmark file.
- Tag abbreviations are now settable.
- Added the `load OpenMeta tags` command, which lets you write AppleScripts that bring changed tags from OpenMeta to EagleFiler, rather than the reverse (which EagleFiler does automatically).

Interface Tweaks

- EagleFiler now shows the spinning progress indicator for all types of activity (not just imports and merges), and next to the spinner it describes one of the more important things it's currently doing. This should make it much easier to see what's happening without having to open the [Activity](#) window, although you can still do that by clicking the progress indicator.
- The notes text view now accepts click-through, so it's smoother to switch to it and begin typing.
- You can now Tab (and Shift-Tab) between the source list and the records list without having to hold the Control key.
- When running on Mac OS X 10.6 or later, EagleFiler now displays file sizes using base-10 megabytes (to match the Finder).
- The default behavior is now to open `x-eaglefiler` links in an existing window if possible. You can use the [esoteric preferences](#) to make it create a new window instead.
- The **Info** inspector now shows a proxy icon in its title bar for the file being inspected, and you can Command-click on it to show a path menu.
- The new [Edit Notes](#) menu item (Command-Shift-E) opens the **Info** inspector and gives the notes keyboard focus. This makes it easier to quickly add notes to a record.
- When importing a single record, EagleFiler's Growl notification now shows a thumbnail of it instead of the EagleFiler icon. This can help you see whether a Web page was imported correctly or whether it depends on session state that is not available to EagleFiler (requires Mac OS X 10.5 or later).
- The text view options (e.g. whether **Check Spelling While Typing** is enabled) are now synchronized between the viewer and the **Notes** view in the **Info** inspector.
- Added the `CaseSensitiveTagCompletion` [esoteric preference](#), which makes it easier to type new tag names that are similar to existing tags but with differing case.
- Removed [Contents of Record](#) from the default toolbar because most of its functionality is now available by double-clicking.
- Enabled undo in various text fields (this requires Mac OS X 10.6 due to a bug in previous OS versions).
- To reduce clutter, the [Activity](#) window is now hidden by default. (If you open it via the menu or by clicking the progress spinner, EagleFiler will remember to re-open it.)
- Moved the **Close** commands higher in the **File** menu.
- Improved the design of the [Software Update...](#) and [Purchase...](#) windows.
- Improved the progress icon for metadata backups.
- Updated the disk image layout.

Miscellaneous

- When importing a file that it downloaded itself, EagleFiler has always stored the source URL. Now it also tries to store the source URLs for files downloaded by other applications.
- EagleFiler is better at displaying and opening alias files.
- Various non-downloadable URLs are now always imported as bookmarks.

- EagleFiler’s metadata backup files now use relative rather than absolute paths. This makes syncing libraries between multiple Macs more efficient.
- The date added is now restored from metadata backups.
- EagleFiler does a better job of cleaning up the title when importing a file.
- Added ! as an allowed tag character.
- Added « and » as allowed tag name characters.
- Improved EagleFiler’s error reporting when opening search index files.
- Improved EagleFiler’s error reporting when a mailbox file is missing.
- EagleFiler is faster at creating bookmarks from non-Web URLs.
- Made some improvements to the crash reporter.
- EagleFiler can now import plain text notes from metadata backup files that are missing the RTFD data.

Bug Fixes

- EagleFiler now reports an error rather than hanging when you ask it to import an `x-eaglefiler` URL.
- Made a change to prevent Zoom/2 from causing an internal error when resizing the source list.
- Fixed a bug where EagleFiler would sometimes quit when coming out of trial mode.
- Fixed a bug in which EagleFiler would let you try to rename a file using an invalid name.
- Fixed an internal error when formatting file sizes.
- Fixed a bug where setting the title/filename/from/tags from the selection in the viewer didn’t work if the field in question was currently being edited in the **Info** inspector.
- Fixed a bug where changing a the filename in the **Info** inspector didn’t update a linked title.
- Fixed a bug where EagleFiler would sometimes report an error when displaying an e-mail message.
- Fixed a bug with tag auto-completion and non-ASCII characters.
- Fixed a bug where EagleFiler could hang when importing non-Web URLs.
- Worked around a bug in Firefox that could prevent EagleFiler from importing dragged images.
- Fixed a bug where EagleFiler stripped a trailing period from the name when importing a folder.
- Worked around some OS bugs that caused slowness and prevented EagleFiler from displaying Web archives created from Safari Reader.
- Fixed a bug where a smart folder that searched for an empty **From** didn’t work.
- Fixed a bug where PDF files that are unreadable by Preview could not be imported into an EagleFiler library.
- Worked around an OS bug that could cause crashes when indexing Web archives.
- Fixed scaling when printing PDF files.

- Fixed a bug where choosing **Actual Size** when viewing a PDF didn't make the change stick.
- Fixed a bug where EagleFiler would re-save metadata property list files that hadn't changed, which could lead to incorrect folder modification dates and sorting.
- Fixed a bug displaying non-Roman Finder label names (requires Mac OS X 10.6 or later).
- Fixed a bug where the scroll position of a .eml file could get reset when switching applications.
- Fixed a bug where certain long filenames would be imported with hexadecimal abbreviations.

1.4.14—January 22, 2010

- Fixed a regression that sometimes caused errors when opening a library window when running on Mac OS X 10.4 or 10.5.

1.4.13—January 21, 2010

- Improved EagleFiler's responsiveness with libraries containing many files.
- Updated the [instructions](#)¹¹¹ for how to make EagleFiler's capture key work with Preview on Mac OS X 10.6. EagleFiler will automatically show this when you try to capture from Preview.
- [Google Chrome](#)¹¹² does not have sufficient AppleScript support to work with EagleFiler's capture key, so EagleFiler will now display a message that tells how you can add an EagleFiler button to Chrome's toolbar.
- Added the [Convert Plain Text to Rich Text](#)¹¹³ script.
- Added # as a word character for indexing, so that you can search for preprocessor directives and hashtags. This will take effect for new libraries or if you rebuild your indexes by holding the Command and Option keys when opening a library.
- Added the [Drag and Drop](#) section of the manual and expanded the [Importing Mail](#) and [The Edit Menu](#) sections.
- Improved the styling of the Apple Help.
- Fixed a bug searching for certain terms with **Match Partial Words** enabled.
- Fixed a regression where EagleFiler wouldn't launch on a PowerPC G3-based Mac.
- Fixed a bug dragging iChat files.
- Fixed a bug where messages didn't sort properly by **Date Created**.
- Fixed a bug where some closed windows still showed up via AppleScript.
- Fixed a bug where EagleFiler would crash when processing certain invalid URLs.
- Worked around a bug in Mac OS X 10.6 that could cause inconsistent font sizes in the contextual menus.

¹¹¹<http://c-command.com/blog/2009/12/28/capture-from-preview/>

¹¹²<http://www.google.com/chrome>

¹¹³<http://c-command.com/scripts/eaglefiler/convert-plain-text-to-rich-text>

1.4.12—December 8, 2009

- EagleFiler is faster at building a mailbox’s table of contents after importing it.
- You can now use the characters `[]{}=#.` in tag names.
- The **Date Created** for e-mail messages now shows the date from the message’s headers rather than the creation date of the mailbox file.
- Added the **ViewEMLOnTiger** [esoteric preference](#), which is useful for people who want to use Microsoft Entourage as their external mail viewer on Mac OS X 10.4.
- Tweaked the spacing in the source list to match Mail.
- Tweaked the positions of the tag icons in the source list when it’s set to large icon mode.
- The **New Record ▸ Open Stationery Folder** command now opens the folder instead of revealing it.
- EagleFiler is now more robust with respect to errors when importing mail from Entourage, Mailsmith, and PowerMail.
- Fixed a bug where read records might be tagged as unread when restoring from a meta-data backup.
- Fixed a bug where, in some circumstances, EagleFiler could display an error message or crash when undoing too many times in the record viewer.
- Fixed a bug where the **Tag Cloud** didn’t immediately update after changing the font in the preferences.
- Fixed a bug where Command Up/Down didn’t move the insertion point in a text document when the viewer had keyboard focus.
- Fixed a bug opening files in MacVim.
- Fixed a bug where EagleFiler didn’t show the alternating row background colors after a failed search.
- Fixed a bug capturing from [Flock](#)¹¹⁴ when using Mac OS X 10.4.
- Fixed a bug capturing large amounts of mail from PowerMail at once.
- Fixed a regression where some icons in sheets were drawn as dimmed.
- Fixed a bug where **New Record ▸ Open Stationery Folder** and **Reveal in Finder** didn’t work if TableText or another old application was running.

1.4.11—November 12, 2009

- The **EagleFiler: Import** service (for importing the selected text, URL, or files) is now enabled by default on Mac OS X 10.6. You may still need to log out and log back in for the system to recognize it, however.
- Worked around a change in Mac OS X that could make EagleFiler report an error when opening a library.
- Fixed a regression where sometimes EagleFiler didn’t open files in the proper external viewer/editor application.

¹¹⁴<http://www.flock.com>

1.4.10—November 10, 2009

- EagleFiler can now capture from Microsoft Exchange mailboxes in Apple Mail.
- Updated the [How can I put my library on my iPhone?](#) section of the manual with a link to the Dropbox iPhone application.
- You can now double-click an embedded file in the viewer or notes to open it in a separate window for viewing.
- Improved the instructions for [importing mail](#) from Thunderbird.
- The [script](#)¹¹⁵ for quickly creating new text files from LaunchBar will now let you enter tags as well.
- If a bug in Mac OS X 10.6 has erased the OpenMeta tags for a file that EagleFiler is importing, it will now look under `kMDItemOMUserTags`, which Spotlight may have preserved.
- Deleting a tag now removes it from the shared list of recent tags, so that it doesn't appear to still be hanging around.
- Worked around a change in [Flock](#)¹¹⁶ so that EagleFiler can capture from it again.
- EagleFiler now displays image files according to the orientation information in their metadata (requires Mac OS X 10.6 or later).
- EagleFiler now writes the tags to `kMDItemOMUserTags` (and sets `kMDItemOMUserTagTime`) for compatibility with newer versions of OpenMeta.
- EagleFiler now gives priority to the `org.openmetainfo` extended attributes if they're present and have more recent timestamps. This will make it possible to transition away from keys in Apple's domain.
- Added the `RecordsListHasAlternatingBackground` [esoteric preference](#) for people who prefer a solid white background color in the records list.
- When you ask it to create a new file, EagleFiler no longer replaces / in the filename with -.
- To avoid confusion with the single-selection case, pressing Return in the records list no longer opens multiple selected records externally.
- Fixed a bug where the keyboard shortcut for [New Record > Plain Text File](#) didn't work under non-English localizations.
- Fixed a bug in the URL colorer that prevented some message bodies from being displayed.
- Fixed a bug that could result in empty tag names after renaming.
- Worked around a suspected bug in Mac OS X that could prevent EagleFiler from restoring the correct window position and size when opening a library.
- Fixed a bug where some individual message files didn't sort properly by title.
- Fixed a bug with the French localization when creating a new file.

¹¹⁵<http://c-command.com/scripts/eaglefiler/launchbar-import-text>

¹¹⁶<http://www.flock.com>

- Changed the way the [Software Update...](#) feature finds the downloads folder on Mac OS X 10.5 and later because sometimes the one that Internet Config returned would be invalid or unwanted.
- Improved EagleFiler's error handling when it can't read a metadata backup file due to a disk error.
- Modernized the code.

1.4.9—September 4, 2009

- When using Mac OS X 10.6, you can use the **Keyboard** pane in System Preferences to add EagleFiler's import service to contextual menus in your other applications.
- Added the `OpenEagleFilerURLsInNewWindow` [esoteric preference](#), which can be used to make EagleFiler open record links in an existing window rather than creating a new one.
- When dragging from the records list, EagleFiler now makes `x-eaglefiler` URLs available (instead of titles) when the receiving application expects plain text. This makes it possible to, e.g. drag and drop to [Things](#)¹¹⁷ to create a link to an EagleFiler record.
- EagleFiler now preserves the flagged state when capturing from Yojimbo.
- Updated the [How can I put my library on my iPhone?](#) section of the manual to reference Quickword, which allows editing of plain text and Microsoft Word documents from the iPhone.
- Added a note saying that accessing EagleFiler's Dock menu (e.g. to open a recent library) requires a right-click or a Control-click under Mac OS X 10.6.
- Added a workaround for an error logging bug in the OS.
- Improved number entry in the smart folder editor.
- Fixed an appearance glitch when dragging from the [records list](#).
- Worked around a bug in Mac OS X 10.6 that could cause EagleFiler to crash when indexing.
- Worked around a bug in Mac OS X 10.6 that could prevent some files from being indexed.

1.4.8—August 24, 2009

- Capturing a bookmark from NetNewsWire, OmniWeb, Safari, and WebKit Nightly is much faster because EagleFiler no longer goes online to download the contents of the page.
- The records list now supports click-through. This means that it no longer takes two clicks to select a different record when one of the inspector windows has focus.
- Added an optimization so that image files with custom icons can be displayed in the records list without having to ask Quick Look to generate a thumbnail.
- Improved the library opening speed by reducing the time spent building the action menu.
- The [How can I access my library from multiple Macs?](#) and [How can I put my library on my iPhone?](#) sections of the manual now discuss SugarSync.

¹¹⁷<http://culturedcode.com/things/>

- Updated the [How can I put my library on my iPhone?](#) section of the manual to add a link to Apple’s new MobileMe iDisk app.
- The [Errors](#) window now appears on all spaces.
- EagleFiler no longer auto-opens the [Errors](#) window at launch if it was open at quit.
- The crash reporter works better with pre-release versions of Mac OS X 10.6 (Snow Leopard).
- The software updater now supports two-digit version numbers like “1.4.10”—just in case.
- Made the progress window wider so that the text fits better.
- Updated the links for Mailsmith’s new home.
- Fixed a bug where EagleFiler’s auto-conversion from an RTF file to RTFD (e.g. when you pasted in an image) could overwrite a pre-existing RTFD file.
- Fixed a bug where the [Reply to Message](#) command didn’t work properly with Entourage.
- Fixed a bug where EagleFiler sometimes didn’t let you type a space in the [Capture with options](#) window.
- Fixed a bug where the fields and text view in the **Info** inspector would lose keyboard focus when switching to another application.
- Fixed a bug where editing in the records list wasn’t committed before switching to an inspector.
- Fixed a bug where importing a `.webloc` file via drag and drop didn’t set the proper source URL.
- Fixed a bug where the record viewer would not remain collapsed when resizing the window.
- Fixed a bug where double-clicking on a column header in the records list would open the selected records.
- Fixed a bug where, for the first [Capture with options](#) for a library, EagleFiler would suggest the “unread” tag even if the preferences were set not to mark new records as unread.
- Fixed a bug where EagleFiler would report an error when importing an empty message from Apple Mail.

1.4.7—July 28, 2009

- EagleFiler now copies tags into the extended attributes for Spotlight searchability and interoperability with [applications](#)¹¹⁸ that use [OpenMeta](#)¹¹⁹ (requires Mac OS X 10.5 or later). EagleFiler also integrates with OpenMeta’s list of recent tags and (since version 1.4.5) imports tags that were assigned using OpenMeta. As with previous versions, EagleFiler’s primary tag store is its database, so you won’t lose any metadata if you store, edit, or copy files in a manner that discards extended attributes, or if you restore from a Time Machine backup. Once a file is in EagleFiler, the tags must be edited

¹¹⁸<http://code.google.com/p/openmeta/wiki/OpenMetaApplications>

¹¹⁹<http://openmeta.info.org>

using EagleFiler. The [Copy tags to Spotlight comments](#) option still works, but since OpenMeta support makes it largely redundant it is no longer recommended except for use on Mac OS X 10.4 and for interoperability with non-OpenMeta applications.

- EagleFiler now displays thumbnail icon previews of image files (requires Mac OS X 10.5 or later).
- Improved EagleFiler's capture support for [Journler](#)¹²⁰. It now preserves the tags, comments, images, and resources, and it omits the entry header.
- Revealing a message in the Finder now reveals a `.eml` file instead of an `.emlx` file. You can use **File** > **Get Info** on this file to make Entourage the default message viewer.
- When exporting messages, EagleFiler now adds a `.mbox` file extension so that Entourage will recognize that it can import from the file.
- Improved the Web archives that EagleFiler imports from pages served as XML.
- Now shows [Growl](#)¹²¹ notifications when using drag and drop to copy files from one library to another.
- EagleFiler now shows a library's spinning progress indicator for all types of user-initiated operations, not just imports.
- Improved the parsing of invalid e-mail addresses.
- Increased the default capacity of encrypted libraries.
- Fixed a bug where EagleFiler allowed editing of locked files and then didn't save them properly (due to a suspected OS bug).
- Fixed a bug where some auxiliary frame content wasn't saved into Web archives.
- Fixed a bug where tags and notes were not preserved when dragging a bookmark from one library to another.
- Fixed a bug where Control-Tab didn't work with Web views.
- Fixed a bug where certain Web pages wouldn't import from Safari via the [bookmarklets](#)¹²².
- Fixed a bug where the search field lost focus after pressing Return/Enter.
- Fixed a bug updating the search field label.
- Fixed a bug where some file URLs wouldn't import via bookmarklets.
- Fixed a bug creating Web PDFs from non-conforming URLs.
- Fixed a bug importing messages with `X-From_` headers.
- Fixed a bug importing messages from Entourage with Mac linebreaks and unescaped "From " lines.
- Fixed a bug indexing notes for libraries inside non-ASCII-named folders.
- Fixed a bug where EagleFiler highlighted search operators in the viewer.
- Removed a Web archive workaround that's no longer needed due to a bug fix in Safari 4.

¹²⁰<http://www.journler.com>

¹²¹<http://growl.info>

¹²²<http://c-command.com/eaglefiler/bookmarklets>

- Updated the French localization.

1.4.6—June 1, 2009

- The [Drop Pad](#) window now appears on all spaces.
- When creating a Web archive, EagleFiler now uses the proper page title for Web sites such as [gmane.org](#) that change the title using JavaScript.
- Added `+$*/~()|%^&` as characters allowed in tag names.
- The search fields are now scrollable.
- The ruler is now shown by default for editable rich text files.
- Added keyboard shortcuts for showing, copying, and pasting the ruler.
- Updated to version 1.1.7 of the SkimNotes framework.
- Updated the instructions for changing an encrypted library’s passphrase to work around a bug in Disk Utility.
- Improved the display of messages containing invalid Base64 content.
- No longer adds a useless `x-msg` URL to the bottom of text imported from mail messages as RTFD.
- Worked around a bug in the Safari 4 beta that could cause some images not to be saved into Web archives.
- Fixed a bug where the search wasn’t cleared when opening a folder in a new window with the `ClearSearchWhenChangingSources` esoteric preference enabled.
- Fixed a bug where changing the plain text font didn’t change the font of newly typed text.
- Fixed a bug where the raw source for a message would sometimes show one extra character.
- The crash reporter works better with pre-release versions of Mac OS X 10.6 (Snow Leopard).
- The crash reporter now warns before sending a report without an e-mail address.
- You can now press Enter to click the **Send Report** button in the crash reporter.
- Updated Korean localization.

1.4.5—March 24, 2009

- When capturing from Apple Mail, EagleFiler can now directly import messages that are selected in smart mailboxes and in special “merged” mailboxes such as **Inbox**.
- When you do a library search for a phrase, EagleFiler now removes the quotation marks when transferring the query to Preview or Skim.
- EagleFiler now imports tags that are stored in a file’s extended attributes under `com.apple.metadata:kd` by applications such as Tags, TagIt, and Default Folder X.
- Improved compatibility with pre-release versions of Mac OS X 10.6 (Snow Leopard).
- Added the `assigned tag names` AppleScript property, which can make writing scripts less verbose.

- Added the `ExcludeIndexesFromBackup` [esoteric preference](#) to exclude EagleFiler's index files from Time Machine backups.
- Added the `FindPanelDiacriticInsensitive` [esoteric preference](#).
- Worked around bugs in Microsoft Excel and Word that could cause EagleFiler to import the wrong document.
- EagleFiler's temporary files are now excluded from Time Machine backups.
- Worked around a bug in the Safari 4 beta that could make [Convert For Editing](#) not preserve images.
- Worked around a change in Safari 4 that could cause problems when displaying or indexing Web archives.
- EagleFiler now closes files immediately after you're done viewing them.
- Fixed a bug where the **Errors** window did not transform filenames for display.
- Fixed a bug where EagleFiler didn't show Growl notifications after importing certain files via AppleScript.
- Fixed a bug where sometimes changes to a text or RTF document were not saved before opening the file in an external editor.
- Fixed a bug with the date format in mbox files.
- Fixed a bug where EagleFiler did not follow aliases in the [Stationery](#) folder.

1.4.4—February 11, 2009

- Streamlined capturing from Apple Mail. EagleFiler no longer asks whether you want to capture the selected mailboxes or the selected messages; now it always captures the selected messages. Also made other changes to reduce the number of dialog boxes.
- You can now use Command-Down-Arrow (**Reveal in Container**) with a message or file selected to have EagleFiler select it inside its containing mailbox or folder in the source list. This is useful if you had originally selected the message or file in **Records**, a tag source, or a smart folder and you want to see it in its original context.
- When you ask EagleFiler to import a file (e.g. by dropping it onto EagleFiler's Dock icon or choosing **Open With** ▸ **EagleFiler**) that's already in the current library, EagleFiler now opens the file for viewing rather than complaining that it's already in the library.
- EagleFiler now uses non-modal notification windows (Growl, where available) to display the progress when capturing from a mail program.
- EagleFiler now uses its own **Find** panel everywhere, not relying on the system **Find** panel, in order to avoid having two separate windows and to improve the interaction with the search field.
- Added the `SendsWholeSearchString` esoteric preference, which lets you control whether EagleFiler updates search results as you type.
- When you search for a phrase, EagleFiler now tries to highlight the whole phrase in the viewer, rather than the constituent words.
- The **Find** panel works better with Spaces.

- Items in the **Services** menu can now read the selection from EagleFiler's records list.
- You can now use the capture key to import *New York Times* Web pages that are in printer format, without having EagleFiler download the screen format instead.
- When importing Web pages as RTF(D), EagleFiler now stores the URL in the file's Subject field.
- When you do a library search for a phrase, EagleFiler removes the quotation marks when transferring the query to the **Find** panel.
- When creating PDFs from Web pages, EagleFiler no longer inserts your username into the PDF metadata.
- When you press the capture key, EagleFiler now bounces its Dock icon once. This makes it easier to see that the capture has begun if the Dock was hidden or the sound was turned down.
- When creating a new plain text file with the **File** column hidden, if you enter a filename with an extension into the sheet, EagleFiler uses that extension instead of `.txt`.
- When merging mailboxes that are selected in the source list, EagleFiler no longer maintains the selection when the mailboxes are moved to the trash.
- Deleting multiple errors at once is much faster.
- You can now use **Page Setup** to change the orientation and scaling when printing.
- When printing a text view, no longer scales down the width unless it's necessary to fit it on the page.
- The print job title now shows the title of the document being printed, rather than the name of the library.
- If a file wasn't downloaded from the Internet, its source URL is now empty rather than being a `file: URL`.
- If there's an error capturing from Firefox, EagleFiler now suggests uninstalling Default Folder X to work around a bug in Firefox.
- Tooltips in the **Errors** window now show the full path rather than just the name of the file.
- Worked around an OS bug that could cause problems when importing text from Apple Mail via services.
- Better error reporting when EagleFiler encounters an AppleScript bug in NetNewsWire.
- Improved handling of long library names.
- Improved the error reporting when capturing from DEVONthink.
- Fixed a bug where EagleFiler would start importing a file that was copied into the **To Import** folder while the copy was still in progress.
- Fixed a bug where indexing could hang if analyzing the file produced a large number of errors.
- Fixed a bug where some *Boston Globe* Web pages were downloaded as HTML files instead of as Web archives.

- Fixed a regression that could prevent MailTags from being imported from Apple Mail if the message also had annotations.
- Fixed a bug where files that didn't have notes could be imported with the `note` tag if it was in the Spotlight comments.
- Fixed a bug where the URL wasn't properly set when importing Web page text as RTFD via drag and drop.
- Fixed a bug where, when importing IMAP messages from Apple Mail, EagleFiler would sometimes incorrectly report that attachments were missing.
- Fixed a bug where the tags bar was hidden when it shouldn't have been.
- Fixed a bug where the scroll arrows for the notes text view didn't work.
- Fixed a bug handling errors when importing Web archives.
- Tried to work around a URL cache problem that could cause imports to stall.

1.4.3—November 20, 2008

- EagleFiler can now display [Skim](#)¹²³ notes attached to PDF files.
- Added an [esoteric preference](#) to make EagleFiler import the selected text from a Web view in RTF(D) format rather than as a Web archive.
- Added an [esoteric preference](#) to control whether EagleFiler displays images in HTML e-mails, for those concerned about Web bugs.
- The color list tab is now available in the color panel.
- In the records list, pressing Return now edits the filename rather than opening the file.
- EagleFiler now preserves filesystem metadata when editing a smart folder's `.plist` file.
- PDF annotations are now indexed for searching.
- The [metadata backup](#) files are no longer touched unnecessarily, for more efficient backups and syncs.
- Improved error reporting when emptying the trash.
- Fixed a regression where some files couldn't be deleted.
- Fixed a bug where tag searches with partial word matching didn't work with non-lowercase tag names.
- Fixed a bug where EagleFiler did not report unexpected errors when viewing files.
- Fixed a bug displaying property list files that were not dictionaries.
- Fixed a bug in the German localization for smart folders.
- Fixed a bug where text could be truncated when printing.
- Fixed a bug displaying Web archives created from Mail.

1.4.2—October 30, 2008

- Fixed a regression where the + button in the source list didn't work.

¹²³<http://skim-app.sourceforge.net>

- Fixed a regression where phrase searches found records that didn't match.

1.4.1—October 28, 2008

- The **Tag Cloud** window now supports tagging/untagging multiple records at once.
- You can now setup a stationery file's Spotlight comments so that new records created from that stationery have certain tags and/or notes.
- EagleFiler now supports metadata AppleScripts to customize what happens when you create a new record from stationery. For example, for a journal entry a script could set the From to the name of the current user and set the filename based on the current date. This is described in the [New Record > Open Stationery Folder](#) section of the manual.
- The Quick Look window now works more like in the Finder. Instead of multiple windows, there's now a single window whose content changes depending on what's selected.
- Added some toolbar shortcuts: Option-click the **New RTF** button to create a new plain text file, and Option-click the **Tags** button to open the **Tag Cloud** window.
- EagleFiler can now display Scalable Vector Graphics (SVG) images.
- EagleFiler now displays XHTML files as rendered HTML rather than as XML source.
- Faster tag searching in Anywhere searches.
- EagleFiler now understands `.url` files.
- Made some AppleScript improvements: creation and modification dates are now settable, the `import` command now has an option for importing a named stationery file, you can update record checksums, and you can set the contents of the search field. An [example script](#)¹²⁴ shows how to initiate an EagleFiler search from LaunchBar.
- When you click to edit in the **File** column, EagleFiler no longer selects the file extension. (Previously, this only worked when pressing Enter.)
- When importing a selection of text via the **Services** menu, EagleFiler now stores the source URL if the text was in a WebKit-based view (requires Mac OS X 10.5). Due to a bug in Mac OS X 10.4, dragging and dropping text onto EagleFiler's Dock icon now requires Mac OS X 10.5.
- For consistency with the Finder, the **Label** column of the records list now shows “_” instead of “None” and sorts by name instead of number.
- Now uses “&” as the default prefix when copying tags to the Spotlight comments.
- Improved reporting of unexpected errors.
- Undo now works when the **Tag Cloud** window is in the front.
- Changed the zooming keyboard shortcuts so as not to conflict with the ones for Universal Access. (You can still use Command- and Command-+.)
- Fixed spacing of **Set Title** in contextual menu.
- Added **Help** button to the **Software Update** window.
- Removed extra space in contextual menu.

¹²⁴<http://c-command.com/scripts/eaglefiler/launchbar-search>

- Fixed a bug trying to open the **Find** panel when EagleFiler was displaying an image.
- Fixed a bug where some toolbar icons didn't load if you weren't running under an administrator account.
- Fixed a bug where the **Find** panel didn't always pick up the query from the search field.
- Fixed a regression where messages in mailboxes could not be opened in Apple Mail when running on Mac OS X 10.4.
- Fixed a regression where Spotlight comments on files weren't preserved when importing, if you had [Copy tags to Spotlight comments](#) unchecked.

1.4—October 14, 2008

Highlights

- You can now create custom smart folders, which can contain an unlimited number of criteria, optionally using nested Any/All/None criteria. Creating and editing smart folders requires Mac OS X 10.5; however, once created, the smart folders can be used with Mac OS X 10.4.
- Smart folders can now be organized into folders.
- You can define *actions* to occur when you drag a record onto a smart folder. For example, you could make a smart folder that shows records with a certain combination of tags, and that will assign those tags to dragged records.
- You can now create any type of new file from within EagleFiler. To do this, choose [New Record > Open Stationery Folder](#) from the **File** menu. Whichever files you put in the **Stationery** folder become available as templates in the **File > New Record** menu.
- You can now drag messages out of mailboxes to convert them to freestanding `.eml` files. It's less efficient to store messages individually rather than in mailbox files, but there are also several advantages: the messages can be stored alongside other types of files, they can be freely moved between folders, and they are searchable by Spotlight.
- Added a [Tag Cloud](#) window, which shows a compact listing of all the tags. You can click on a tag to toggle whether it's assigned to the selected record.
- Added a **Find** panel for searching within PDFs and Web archives.
- Added a preference to control which format Web pages are imported in. The supported formats are: Bookmark, PDF, Plain Text, Rich Text, Rich Text With Images, and Web Archive (the default).
- Added a preference to control what happens to Spotlight comments when importing. This is useful, e.g. if you had already used another application to tag your files or if you had entered notes from the Finder. If you tell EagleFiler to **Import as tags**, each word is imported as a tag. If you tell it to **Import as notes and tags**, EagleFiler extracts tags (prefixed by `&` or marked using Punakea's format) and imports the remaining comments text as notes.
- Added commands to the contextual menus (**Assign Tag**, **Set Filename**, **Set From**, **Set Title**) so that you can quickly turn the selected text into metadata.

File Formats

- Added [New Record](#) ▸ [Plain Text File](#) command.
- EagleFiler can now display Microsoft Word 2007 ([.docx](#)) files (requires Mac OS X 10.5).
- EagleFiler can now display and edit OpenDocument Text ([.odt](#)) files (requires Mac OS X 10.5).
- EagleFiler can now display and search XML and binary property list ([.plist](#)) files.
- Now imports [.webloc](#) files as-is rather than converting them to Web archives.
- EagleFiler now imports [.eml](#) files as-is rather than converting them to single-message mailboxes.
- [Bean](#)¹²⁵ documents are now imported as a separate file type rather than as RTFD.

Interface

- Added [Quick Look](#) command, which opens a Quick Look preview of the selected records in a separate window (requires Mac OS X 10.5).
- Added an [Enclosing Record](#) command in the **View** menu. Replaced the **Select Source** command with the similar but more useful [Contents of Record](#) command in the **View** menu. As a result, you can now use Command–Up Arrow and Command–Down Arrow to navigate up and down the hierarchy of folders and mailboxes.
- Added **Search for Selection** contextual menu command.
- When you mouse over a link in a Web view, EagleFiler now shows the URL at the bottom of the window.
- Revised the toolbar icons and simplified the default toolbar configuration.
- If there are no matches for a search, EagleFiler draws the records list background in yellow.
- Adjusted the unread and flagged menu item titles and toolbar labels for consistency with Mail.
- Increased the resolution of the Dock badges.
- The viewer now shows some helpful text describing the “note” tag.
- Moved **Show Inspector** and [Show Tags](#) from the **Record** menu to the **Window** menu and renamed **Show Inspector** to [Show Info](#).

Capture

- Can now capture from [Entourage](#)¹²⁶, and preserves the message flags, categories, and projects. If you want EagleFiler to skip a message, you can assign it the category “OmitFromArchive”.
- Can now capture from [PowerMail](#)¹²⁷, and preserves the message status and label.
- Can now capture from [Preview](#)¹²⁸, if you [make it scriptable](#)¹²⁹.

¹²⁵<http://www.bean-osx.com>

¹²⁶<http://www.microsoft.com/mac/products/entourage2008/default.msp>

¹²⁷<http://www.ctmdev.com/powermail5.html>

¹²⁸<http://www.apple.com/macosx/features/pdf/>

¹²⁹<http://www.macworld.com/article/53391/2006/10/previewscript.html>

- Can now capture from [Together](#)¹³⁰, and preserves the tags, comments, labels, and ratings.
- When capturing from [Mailsmith](#)¹³¹, EagleFiler can now import individual messages (before, only mailboxes were supported), and it now preserves the message status, label, and notes.
- When capturing from [Camino](#)¹³², EagleFiler now reads the URL of the current tab rather than the first tab.
- In the [Capture With Options](#) window, if you edit the tags and then choose a different library, EagleFiler no longer overwrites the tags with the default ones for the new library.

Importing

- You can now import Web pages using [bookmarklets](#)¹³³.
- Empty files and files that contain only a resource fork (such as font suitcases) no longer count as duplicates.
- Added an esoteric preference for importing Spotlight keywords as tags.
- When you try to import a file that's already inside of the library folder, EagleFiler can now reveal the file in the browser window.
- If a connection times out while EagleFiler is importing a Web page, it will now retry twice.
- When importing bookmarks from a Web browser, EagleFiler now uses the titles you've assigned rather than fetching them from the Web.

Miscellaneous

- Encrypted libraries can now be created as sparse bundle images, for more efficient Time Machine backups (requires Mac OS X 10.5).
- Encrypted libraries can now use 256-bit rather than 128-bit encryption (requires Mac OS X 10.5).
- You can now type tag names directly into an **Anywhere** search.
- You can now view messages in Microsoft Entourage instead of Apple Mail (requires Mac OS X 10.5). To do this, **Get Info** on a `.eml` file in the Finder, choose Entourage from the **Open with** pop-up menu, and click **Change All**.
- The [Copy Record Link](#) command now creates links using persistent IDs so that they will still work if you delete EagleFiler's database and import the files into a new library.
- Added [How can I put my library on my iPhone?](#) section to the manual.
- Added [Shortcuts](#) section to the manual.
- Added an esoteric preference to clear the search field when you select a different source.
- You can now double-click a smart folder to open it in a new window.

¹³⁰<http://reinventedsoftware.com/together/>

¹³¹<http://www.mailsmith.org>

¹³²<http://www.caminobrowser.org>

¹³³<http://c-command.com/eaglefiler/bookmarklets>

- EagleFiler now indexes a file's Spotlight keywords for searching.
- Improved auto-generated titles.
- Improved the display of improperly encoded message headers.
- Worked around a bug in Mac OS X 10.4 when highlighting matching search terms in the records list.
- Removes stray index files when opening the library.
- If there's an error getting the downloads folder for a software update, EagleFiler now defaults to **Downloads** rather than **Desktop**.
- No longer shows the `--deleted--` tag in the records list.
- The **Untagged** source now shows records that only have the "note" tag.
- Improved parsing of invalid mbox files.
- Improved error reporting when downloading Web pages.
- Rewrote filesystem code to improve performance and error reporting.
- Made various changes to improve interface responsiveness.
- Note files now include a relative URL to the file that they're attached to, so that you can easily find the file if EagleFiler isn't installed.
- Added placeholder text to the [Purchase...](#) window.
- No longer lets Web pages steal focus from the records list.
- You can now bring up the **Find** panel when the source list or records list has focus.
- EagleFiler now saves damaged index files for possible future analysis of why Search Kit couldn't open them. It also tries multiple times to open indexes, since Search Kit sometimes changes its mind about which indexes are valid.

Bug Fixes

- If an unexpected error occurs while EagleFiler is emptying the trash, it no longer leaves the library in an inconsistent state. Also, EagleFiler will now detect and repair this sort of damage when opening a library.
- Fixed a bug where a duplicate "From " line could be inserted when generating an mbox file from an Apple Mail mailbox. This was harmless but unsightly.
- Fixed a bug where, in rare cases, two messages imported from Apple Mail could be joined into one, so that it looked like some had been skipped.
- Fixed a bug where EagleFiler changed the selection if you tried to delete a source and then cancelled.
- Fixed a bug where [Reveal in Finder](#) didn't work when KeePassX was running.
- Fixed a bug where you could, via the contextual menu, open a different page when viewing a Web archive.
- Fixed a bug where EagleFiler could freeze when revealing a non-existent file in the Finder.
- Fixed a bug where EagleFiler's Web fonts would not be consistent with Safari's if you'd never changed the fonts in Safari's preferences.
- Fixed a bug where, when capturing multiple items with notes, some records without notes would be assigned the notes from one of the other records.

- Fixed a bug where certain errors when creating a new library were not correctly reported.
- Fixed a bug where the PDF viewer state wasn't always preserved.
- Fixed a bug where the title of text records wasn't linked to the filename by default.
- Fixed a bug where newly added tags weren't selected if you had been renaming another tag.
- Fixed a bug where EagleFiler could crash when closing a browser window.

1.3.8—July 23, 2008

- Fixed a regression where capturing from Firefox didn't work.

1.3.7—July 22, 2008

- Fixed a regression where editing a keyboard shortcut could cause EagleFiler to crash.

1.3.6—July 22, 2008

- Opening the [Capture With Options](#) window is faster and uses much less memory.
- When capturing a headline from [NetNewsWire](#)¹³⁴, EagleFiler now preserves the flagged status.
- Improved the error message when capturing from [Firefox](#)¹³⁵ 3 fails due to a bug in Firefox.
- Fixed some small memory leaks.
- Fixed bug where `.eml` files converted to mbox format weren't From-escaped.
- Moved `.nib` files that don't need localization out of the `English.lproj` folder. This should make it easier to run EagleFiler in a language other than English without changing the default language on your Mac.
- Fixed bug truncating filenames containing decomposed characters.
- Improved the French localization.

1.3.5—July 2, 2008

- Made various performance optimizations to the browser and activity windows.
- If you click on a mailbox in the source list whose table of contents has not yet been built, EagleFiler now reports this in the viewer so that it's more clear why no messages are shown yet.
- Dropping between folders in the source list no longer targets the containing folder, since this made the subfolder drop targets too small.
- Improved the way EagleFiler handles special “merged” mailboxes when capturing from Apple Mail.
- Added `EnableWebPlugIns` to the [esoteric preferences](#), so that you can prevent Web plug-ins (e.g. Flash) from loading in EagleFiler's viewer.

¹³⁴<http://ranchero.com/netnewswire/>

¹³⁵<http://www.mozilla.com/en-US/firefox/>

- Capturing a mailbox in Apple Mail no longer captures its submailboxes, unless they're also selected.
- Fixed bug extracting the metadata from files during import.
- Fixed a bug where, in rare cases, EagleFiler would end up with two internal database records for the same file. This could happen with Web archives in the `To Import` folder.
- Fixed the title of the **Copy Image** command when Control-clicking on an image in the viewer.
- Fixed bug where EagleFiler would clear the display of the selected Web archive when using [Capture With Options](#).
- Fixed regression where AppleScripting a `browser window` didn't work.
- Reduced the delay before showing the [Capture With Options](#) window.
- The font-chooser text fields now draw the text centered.
- Single-click editing in table and outline views now requires Mac OS X 10.5, since it now relies on the standard OS functionality.
- In certain circumstances, auto-updating no longer requires authentication.
- Fixed bug where some operations in the [Activity](#) window would hang if the OS hung while setting a Spotlight comment.
- Worked around suspected OS bug, which sometimes caused a file's creation date to change when you changed the modification date.
- Fixed bug where the [Capture With Options](#) window would be shown even if there were no items to capture.
- Fixed bug editing filenames with no extension in the records list.

1.3.4—June 3, 2008

- Fixed regression where parts of the Drop Pad didn't accept dropped files.
- Fixed regression where source list titles sometimes would be truncated prematurely.
- Fixed regression where the top of the viewer was cut off in the German localization.
- Fixed regression where changes to the tags weren't saved if you closed the window before pressing Return/Tab or clicking elsewhere.
- The default search scope is now **Anywhere**.
- The divider in the **Info** inspector now remembers its position.
- The **Tags** field in the **Info** inspector can now be made shorter.
- Improved launching speed.
- Added [Importing Mail](#) section to the manual.
- Added `FolderMailboxTitleSeparateFromFilename` to the [esoteric preferences](#).
- Improved error reporting when capturing from Microsoft Word.
- Fixed bug importing Apple Mail messages when running under certain non-English locales.

- Worked around a framework bug that could cause errors when closing a library.
- Removed logging of invalid URLs.
- Updated the German localization.

1.3.3—May 20, 2008

- Improved the speed of displaying large numbers of files or messages for the first time.
- Can now capture from [Opera](#)¹³⁶.
- Added **New Rich Text File** command to the Dock menu.
- The [Drop Pad](#) is now resizable.
- Worked around Mac OS X bug that prevented EagleFiler from indexing certain documents for searching.
- The [Capture With Options](#) window no longer suggests the title from the previous capture, since that wasn't very useful.
- If a mailbox's messages are not yet ready for display (because EagleFiler is rebuilding the table of contents), the mailbox name is now shown in gray in the source list.
- Added placeholder text to the tags bar so that it's more clear that it's editable.
- Expanded the documentation for the [Verify](#) command.
- On Mac OS X 10.4, the viewer pane now shows custom rather than generic icons for files that it doesn't know how to display. (On Mac OS X 10.5, it continues to use Quick Look.)
- When searching, EagleFiler now ignores trailing meta characters in the query string, rather than returning no results.
- The **Drop Pad** menu command now hides the [Drop Pad](#) if it was already visible.
- Reorganized the Dock menu so that the fixed commands are easier to find with the mouse.
- Improved error reporting when capturing from a “merged” mailbox in Mail.
- Adjusted spacing in source list.
- Added “raised” background style to the label in the tags bar.
- Skips importing `.git` folders.
- Improved error logging.
- Fixed bug where the **Tags** palette sometimes showed the tags for the wrong library.
- Fixed bug where the **Tags** field in the [Batch Change...](#) window didn't become checked when you started typing tags in it.
- Fixed bug with text color of non-highlighted text in selected rows of the records list, when it didn't have keyboard focus.
- Fixed error resizing the browser window.
- Fixed importing of Word documents with blank titles.

¹³⁶<http://www.opera.com>

- Fixed bug where the command in the **Window** menu said **Activity Viewer** instead of **Activity**.

1.3.2—April 24, 2008

- Faster indexed searches when lots of results are found.
- Faster at displaying large text files when running on Mac OS X 10.5.
- The **Title** and **From** fields in the [Capture With Options](#) window will now try to clean up any text that you paste in, e.g. removing linebreaks and coalescing multiple spaces into one.
- Enlarged the **Title** field in the [Capture With Options](#) window.
- Some errors now have a tooltip that shows which library they pertain to.
- Preserves more file metadata when editing documents within EagleFiler.
- EagleFiler can now import URLs that contain the | character.
- Adjusted mail-related icons when running on Mac OS X 10.5.
- Added `MaxEditableTextFileSizeInMB` esoteric preference, which lets you set EagleFiler to only show the first few megabytes of large text files, so that they display more quickly.
- Disabled undo in the **Title** and **From** fields in the [Capture With Options](#) window to work around a bug in Cocoa.
- Fixed bug where the viewer could lose keyboard focus when using [Previous/Next Record](#).
- Fixed bug where mailbox names were not indexed for **Anywhere** searches.
- Fixed bug editing text or RTF documents that were stored on non-HFS volumes.
- Fixed bug where indeterminate progress bars didn't animate when running on Mac OS X 10.5.
- Fixed bug importing messages from Apple Mail that claimed to be sent in the year 2038 or later.
- Fixed mbox separator-line dates for imported IMAP messages.
- Fixed regression where files and messages didn't sort together properly by modification date.
- Updated the `.sdef` file to the latest format.
- Updated to Python 2.5.2.
- Renamed the **Activity Viewer** window to [Activity](#) for consistency with Mail and Safari.
- Fixed color of non-highlighted text in selected rows of the records list.

1.3.1—April 9, 2008

- When searching the **Tags** scope (or using `tag:<name>` with another search scope), EagleFiler now lets you type incomplete tag names if **Match Partial Words** is checked.
- The @ character is now allowed in tag names.
- When using [Capture With Options](#), any tags or notes that you set are now used *in addition to* rather than *instead of* any tags or notes suggested by the capture script.

- Changes to notes are now undoable.
- Improved responsiveness by limiting the number of simultaneous file copy operations.
- Fixed regression where [Copy tags to Spotlight comments](#) didn't work.
- Fixed regression editing files in the viewer whose path contained non-ASCII characters.
- Fixed regression deleting notes.
- When you delete the selected sources, EagleFiler now selects the next source in the list and maintains the scroll position.
- Canceling a [Capture With Options](#) now brings you back to the application that you were in.
- The tag abbreviation column now sorts by the actual tag names, rather than by the abbreviation symbols.
- Worked around a Web Kit bug saving certain pages as Web archives.
- Worked around OS bug that could cause a crash when resizing a browser window.
- Tried to work around OS bug revealing files in the Finder.
- After revealing a file in [Path Finder](#)¹³⁷, brings Path Finder to the front.
- Re-positioned **Format** menu for consistency with Mail.
- Fixed a rare crash when searching a PDF.
- Fixed bug where dragging records in the list sometimes required an extra click.
- Fixed sorting of sources, records, and tags whose names contain combining marks.
- Fixed bug where the contextual menu sometimes had duplicate **Highlight** commands.
- Fixed bug where sometimes the original title of a document (stored in the file) wasn't indexed if you'd set a custom title in EagleFiler.
- Fixed bug where `.plist` files were sometimes imported as text.
- Fixed bug where a displayed Web archive could auto-open a window in the user's Web browser.
- Fixed bug remembering the PDF zoom level.
- Updated German localization.

1.3—March 11, 2008

Highlights

- Added [Capture with options](#) command (Option-F1 by default), which lets you set the library, destination folder, tags, and other metadata right when you press the capture key.
- Added [Batch Change...](#) menu command and button in the tags bar. This lets you set the title, from name, label, tags, and notes of the selected records all at once.
- Now uses [Quick Look](#) to display file types that EagleFiler doesn't natively understand (e.g. Pages, Keynote, OmniGraffle, fonts). This feature requires Mac OS X 10.5.

¹³⁷<http://www.cocotatech.com>

- Added **Untagged** smart folder to the source list.
- Added **Date Created** and **Tag Names** columns to the records list.
- Added **Set Label** submenu and contextual menu.
- Added specialized viewing and indexing support for iCalendar (**.ics**) and vCard (**.vcf**) files.
- Now indexes **Skim**¹³⁸ notes attached to PDF and PDFD files so that you can search for them within EagleFiler.
- Revised the icons and layout throughout the user interface.
- Made various optimizations so that EagleFiler is faster and more responsive.

Browser Windows

- When creating new rich text files or notes, EagleFiler now creates RTF files instead of RTFD ones when possible. RTF files are more compatible and faster. Additionally, when editing files in the viewer, EagleFiler automatically converts between RTF and RTFD depending on whether RTFD is required.
- When using the Record ▸ **Tag** command to jump to the tags bar, EagleFiler now moves the insertion point to the end of the tags, rather than selecting all of them.
- When you create a **New Rich Text File** within EagleFiler, it's no longer marked as unread.
- The **Open With External Viewer** toolbar button now shows which application will be used to open the file.
- Added **Update Checksum** toolbar button.
- Now shows tag colors in the source list.
- You can now tab from editing the **File** column in the records list into the record viewer, which makes creating new RTF files smoother. (Requires Mac OS X 10.5.)
- When you open a library on a smaller screen than it was previously opened on, EagleFiler now overrides the OS and shrinks the window so that it fits on the screen.
- Added **Select Source** to the contextual menu.
- Added a custom drag image for the records lists.
- Added ellipsis-truncation to column headers in the records list.
- Increased the maximum width of the date columns.
- Holding down Option to skip the confirmation when emptying the trash now works from the contextual menu.
- When displaying Usenet messages from mbox files, EagleFiler now shows the name of the newsgroup in the **To** area of the viewer.
- You can now copy an image file that EagleFiler's displaying to the clipboard.
- Now remembers between launches if you've set the PDF view to display continuous or facing pages.
- You can now press Command-Delete to delete the selected record(s) when the viewer has focus.

¹³⁸<http://skim-app.sourceforge.net>

- You can now double-click the drag strip to collapse the source list.
- Increased the font size in the tags bar.

Capture

- If no library is open when you press the capture key, instead of showing an error alert, EagleFiler now opens the **Capture with options** dialog, which lets you open or create a library to complete the capture.
- Can now capture from [Address Book](#)¹³⁹, [Flock](#)¹⁴⁰ 1.0, [iCab](#)¹⁴¹ 4, [Keynote](#)¹⁴², [Mind-Manager](#)¹⁴³, [Pages](#)¹⁴⁴, [OmniGraffle](#)¹⁴⁵, and [TextMate](#)¹⁴⁶.
- Revised the user interface for setting the capture key.
- While EagleFiler is in the process of capturing (i.e. running the capture script or showing the capture options dialog), it now badges the Dock icon with a picture of a camera.
- Added `|creationDate|` and `|modificationDate|` options for capture scripts.
- Improved preservation of modification and creation dates when capturing from [DEVONthink Pro](#)¹⁴⁷, [MarsEdit](#)¹⁴⁸, [Journler](#)¹⁴⁹, and [Yojimbo](#)¹⁵⁰.
- Improved the reliability when capturing from [WebnoteHappy](#)¹⁵¹, e.g. if it returns invalid tag, note, or title information.
- EagleFiler now creates the user **Capture Scripts** folder for you.

Miscellaneous

- If EagleFiler is busy when you ask it to close a library, it now stops any existing operations (except when doing so would cause data loss), so you no longer have to wait and/or stop them yourself.
- When dealing with “Bad Checksum” errors in the **Errors** window, you can now update the checksums for multiple errors at a time, and after updating a checksum EagleFiler removes the error from the window.
- Reduced EagleFiler’s RAM use for large libraries.

Importing

- Text dragged from a Web page is now imported as a Web archive instead of an RTFD file. (If you want an RTFD file, you can use the [Convert For Editing](#) command.)
- In addition to checking periodically, EagleFiler nows checks the **To Import** folders when it becomes the active application. This should get new files imported sooner.

¹³⁹<http://www.apple.com/support/leopard/addressbook/>

¹⁴⁹<http://www.journler.com>

¹⁵⁰<http://www.barebones.com/products/yojimbo/>

¹⁵¹<http://www.happyapps.com/webnotehappy/>

- Now shows a single Growl notification for each batch of files imported, rather than for each individual one.
- Now shows a progress spinner next to the action menu while EagleFiler is busy importing.
- Changed the Dock icon indicator that shows when EagleFiler is importing. Instead of a red circle, it now shows a downward pointing arrow.
- Improved EagleFiler's recovery when WebKit runs into an internal error while saving a Web archive file.

Info Inspector

- Added **URL** field.
- Enlarged the **Title** field and **Notes** text view.
- Now displays three dates—Created, Added, and Modified—and the creation and modification dates are editable.
- Fields that are unavailable are now disabled rather than just marked as uneditable.

Search

- Now shows the search scope beneath the search box so that it's clear which parts of the records you're searching.
- When searching, you can now use **OR** as a synonym for **|**, and you can use **-word** as a synonym for **!word**.
- EagleFiler is better at estimating how long indexing will take when some of the records in the library are already indexed.

AppleScript

- The **import** command now returns a list of the imported records. This makes it easier to set the properties of the new records. Additionally, **import** now waits until the records have been imported before returning, so the script knows when the import has finished.
- The **import** command now supports a **deleting afterwards** option, which makes EagleFiler delete the source file after successfully importing it.
- You can now use the **import** command outside of a **tell library document** block; it will then target the frontmost library.
- The **source URL** property is now settable.

Bug Fixes

- The order in the labels pop-up menu now matches the Finder.
- Now remembers the sorted column of the **Tags** inspector between launches.
- Fixed bug where the source URL wasn't set if you imported a URL of a file that wasn't a Web page.
- No longer shows the **Rebuild** dialog when opening a library if you hold down other modifier keys in addition to Command-Option.
- If EagleFiler was unable to capture due to a bug in the Finder, the error message now suggests using drag and drop, updating to Mac OS X 10.5, or disabling FileVault.
- Now preserves the creation date when editing files within EagleFiler and when saving notes.

- Fixed bug where the **Import Files...** command didn't let you import items that were next to the library folder.
- Fixed bug where certain Apple Mail mailboxes (typically those imported from another mail program) weren't imported as mailboxes.
- Fixed bug where the **Reveal** button in the **Errors** window didn't work properly for duplicate files that came from the **To Import** folder.
- Fixed bug where the **Highlight** command didn't work properly when no text was selected.
- Fixed bug where the **Highlight** toolbar button in the main browser window would be enabled when editing a note.
- Fixed bug where EagleFiler would add a uniquing number if you renamed a file/folder to a name that differed only by case (and you were using a case-insensitive filesystem).
- Worked around a Cocoa bug that could, in rare cases, lead to an infinite loop when saving the library.
- Fixed bug where some **Format** ▸ **Font** menu commands were enabled even though they couldn't be used because **Allow Editing in Record Viewer** was unchecked.
- Fixed bug where toggling **Allow Editing In Record Viewer** didn't take effect immediately.
- Fixed crash involving the tags bar.
- Fixed bug where capturing just messages from an Apple Mail mailbox with sub-mailboxes would import empty folders for the submailboxes.
- Fixed bug where newly imported records sometimes didn't sort properly by modification date.
- Fixed bug where the **Info** inspector sometimes didn't show the correct record.
- Fixed bug where custom icons on the **To Import** folder were not preserved.
- The software updater is better at handling invalid downloads folders.
- Fixed crash involving the **Info** inspector.
- Fixed bug where **Edit** ▸ **Find** ▸ **Library Search...** didn't bring the window to the front.
- Fixed bug hiding and showing the source list when running on Mac OS X 10.5.2.
- Fixed bug checksumming packages containing symlinks.
- Fixed bug where JavaScript was disabled in the viewer.

1.2.7—November 14, 2007

- If you create a **New Rich Text File** while one or more tag sources are selected, EagleFiler now assigns those tags to it.
- Colored quote levels now work in HTML messages.
- You can now hold down the Option key to empty the trash without a warning.
- Now uses the proper **Skim**¹⁵² icon for PDFD files.

¹⁵²<http://skim-app.sourceforge.net>

- Combined the three system services into one, which detects whether it was invoked with a file, text, or URL(s). The keyboard shortcut can now be configured using System Preferences rather than a separate utility.
- If you make EagleFiler a login item, set it to be hidden, and have it [set to open a library when it's launched](#), EagleFiler will now re-hide itself after opening that library.
- Drag-importing from MacJournal works now.
- The system service now works properly when EagleFiler wasn't already running.
- Control-clicking on a source group no longer selects it.
- Improved scaling of the library document icon.
- Fixed bug where the Apple Help didn't work on Mac OS X 10.5.
- Fixed regression where assigning/unassigning tags using the Spacebar in the Tags inspector didn't always work.
- Fixed bug displaying some encoded message subjects.
- Fixed regression where the top couple pixels of the viewer could be cut off.
- Fixed bug where the icons of some types of sounds, movies, or images showed the wrong file type.
- Fixed bug where the source list sometimes had the wrong background color.
- Fixed ellipsis truncation of selected source names.
- Updated German localization.
- Added Korean localization.

1.2.6—October 24, 2007

- Modernized the source list and buttons.
- Capturing the selected mailboxes/messages from Apple Mail now works when an IMAP path prefix is set.
- Can now capture from [MarsEdit](#)¹⁵³ (based on work by Eric Blair).
- Added support for [Skim](#)¹⁵⁴ .pdfd bundles.
- Tags in the tag bar and inspectors now have contextual menus that let you reveal them in the source list, to see all the records with that tag.
- Added French and German localizations.
- There are new AppleScripts for importing from [LaunchBar](#)¹⁵⁵ and [Quicksilver](#)¹⁵⁶.
- You can now [modify capture scripts](#) while EagleFiler is open without having to relaunch for it to notice the changes.
- Improved import speed, particularly when the source volume is slow.
- You can now cancel an import in the middle of EagleFiler checksumming a file.

¹⁵³<http://www.red-sweater.com/marsedit/>

¹⁵⁴<http://skim-app.sourceforge.net>

¹⁵⁵<http://c-command.com/scripts/eaglefiler/launchbar-import-text>

¹⁵⁶<http://c-command.com/scripts/eaglefiler/quicksilver-import-text>

- Fixed bug where capturing from Apple Mail didn't work on pre-release versions of Mac OS X 10.5 Leopard.
- Capturing now works with pre-release builds of Camino 1.6.
- **Select Source** now preserves the selection in the records list after selecting the container sources.
- Using the spacebar to toggle tags in the **Tags** inspector now interacts better with type-selection.
- The search field now expands and contracts based on the available space in the toolbar.
- **Convert For Editing** now preserves the title and allows duplicates.
- After deleting a record or tag, EagleFiler will now select the next item in the list.
- Clicking a link to open another EagleFiler record now gives it keyboard focus.
- Now clears Web views that aren't in use, saving memory and silencing sounds.
- Capturing PDF files from Safari now works when the Schubert|it PDF Browser Plugin is installed.
- Renamed the **Library** source to **Records**.
- Improved capture script error reporting.
- Metadata files are now invisible by default, and you can prevent them from being created automatically. There are [esoteric preferences](#) to control this. Also, EagleFiler avoids writing metadata files to disk if they haven't changed.
- After opening a library with EagleFiler 1.2.6, it will no longer be openable in previous versions of EagleFiler. Of course, the files and metadata are still accessible in the Finder.
- Fixed color of selected tags in inspector.
- Fixed memory leak with the **Activity Viewer** window.
- Fixed progress bar inaccuracy when importing a folder of files.
- Fixed bug importing .eml files exported from Thunderbird.
- Fixed bug where certain types of sound files were imported as text.
- Fixed bug displaying attachment names that used the Big5 character set.
- Choosing colors is more robust and defaults to the spectrum view.

1.2.5—August 21, 2007

- Can now capture from [Cyndicate](#)¹⁵⁷.
- Fix bug where Flash was disabled in Web views.
- Fixed bug where the insertion point would sometimes move if you edited in the record viewer and then manipulated the window before it had saved.
- Improved the robustness of the startup code to prevent some rare problems when launching EagleFiler.
- Improved handling of FDF files.

¹⁵⁷<http://cynicalpeak.com/cyndicate/>

- Fixed rare errors importing lots of files at once.
- Verifying checksums is faster.

1.2.4—August 2, 2007

- The records list uses gentler background colors to indicate the files' labels.
- Now shows labels in the source list.
- Added keyboard shortcuts for going to the next or previous PDF page.
- Now shows tooltips in the source list.
- The records list now has an alternating background color, like the Leopard Finder.
- Improved the responsiveness of the user interface when highlighting search matches in PDFs.
- Fixed incorrect outline/table row heights when using certain fonts.
- Now preserves extended attributes when copying files into the library.
- When using [Copy Record Link](#) and pasting into a rich text view, the pasted text's font will now match that of the surrounding text.
- Improved the **Next/Previous** toolbar buttons.
- Dragging from EagleFiler to a burn folder now creates a link instead of copying the file.
- If the **File** column is hidden, both Enter and Option-Enter will bring the **Title** column into edit mode.
- After you drop a file onto a spring-loaded folder in the source list, EagleFiler will collapse the temporarily expanded folders.
- EagleFiler no longer tries to import SketchUp files as text, and therefore it won't try to display them, which led to long freezes as the data overloaded Cocoa's text system.
- Improved capture error messages.
- Fixed bug parsing tags from strings containing non-ASCII alphabetic characters.
- Fixed bug where labels were lost when editing RTF or RTFD files within EagleFiler.
- Now preserves modification dates when capturing from Yojimbo.
- If the records list is empty because nothing matched the search, this is now reported in the viewer so that you don't wonder why the list is empty.
- If [Allow Editing in Record Viewer](#) is off, **New Rich Text File** will now always bring down a sheet for setting the text of the new file.
- Choosing **Edit** ▸ **Find** ▸ **Library Search...** now works when the toolbar is in **Text Only** mode.
- Fixed help book icon.

1.2.3—July 2, 2007

- Calculates folder sizes and shows them in the records list.
- Added `import plain text` AppleScript command for when you want to import a string as a text file rather than an RTF one.

- When you view a file, EagleFiler now makes sure that it's up-to-date in the index, in case you modified it outside of EagleFiler.
- When you edit a filename in the records list, EagleFiler no longer pre-selects the extension.
- The **Errors** window no longer auto-selects errors when they are added.
- Added progress bars when creating or opening a library.
- Rotates the log file to prevent it from growing too large.
- Changed the verification icon.
- Improved error handling when creating or opening a library.
- Fixed bug where folder labels weren't preserved when importing.
- Worked around OS bug that caused an internal error when pressing Option-Tab in an empty text view.
- Errors reported from EagleFiler's lower level frameworks are now reported in the log file rather than on the system console.
- Fixed bug where EagleFiler would let you import the library into itself.
- Fixed regression where canceling an import sometimes didn't work.
- Worked around suspected QuickTime bug that caused EagleFiler to not import the proper ID3 tags from some MP3 files.
- Improved reporting of duplicate file errors.
- No longer tries to import `.localized` files.
- Fixed bug handling locked files and folders.
- Fixed bug where an error could be reported if you emptied the trash when a record in it was selected.
- No longer tries to backup the metadata for missing folders.
- Fixed bug displaying e-mail messages when the chosen font was no longer available.

1.2.2—June 20, 2007

- Fixed bug where some menu commands were disabled when the [record viewer](#) had focus.
- When you view a PDF file, EagleFiler will now update the page count in the [records list](#) in case it has changed.
- Fixed bug where PDF page counts weren't transferred when dragging from one library to another.
- Fixed bug importing text via drag and drop.
- Fixed PyObjC bugs that could cause various crashes and hangs.
- Fixed regression where [Open in Delicious](#) didn't work.
- Fixed icon scaling in [Activity](#) viewer when merging mailboxes.
- Fixed regression where where changing [Allow Editing in Record Viewer](#) didn't take effect immediately.

- Fixed bug where EagleFiler would [re-open at launch](#) even libraries that were in the trash.
- Worked around Cocoa bug that could cause the record viewer's scroll bars to be hidden if you expanded the viewer when the ruler was hidden.
- Fixed bug where EagleFiler tried to import invisible metadata files.
- Fixed bug where the copy cursor was shown when dragging and dropping within the record viewer.
- Fixed bug where the spell-checking state wasn't remembered.
- Fixed bug with the PDF zoom-to-fit state and the contextual menu.
- Worked around PDF Kit bug where the password field wouldn't disappear.
- Fixed bug with **To Import** folders and locked files.
- Fixed bug where EagleFiler let you create a new library on top of an old one.
- Fixed bug indexing certain HTML and Microsoft Word files.
- Fixed bug with multiple backup metadata operations at once.

1.2.1—June 8, 2007

- You can now use the [Export...](#) command to export the selected messages in mbox format, so that they can be imported into any mail program.
- The names of **To Import** folders now include the library name, so that you can tell them apart in a Finder or open panel sidebar.
- Can now capture from [Pukka](#)¹⁵⁸ and [WebKit Nightly](#)¹⁵⁹. When capturing from [Yojimbo](#)¹⁶⁰, now preserves the label as an EagleFiler tag. When capturing from [Cocoalicious](#)¹⁶¹, [Journler](#)¹⁶², [Yojimbo](#)¹⁶³, and [WebnoteHappy](#)¹⁶⁴ now preserves the title rather than extracting it from the file.
- The label colors now more closely match those in the Finder, and the pop-up menu sorts alphabetically.
- The tooltip for the **Tags** column in the records list now shows the names of all the assigned tags.
- [Allow duplicate files in library](#) is now a full preference.
- When copying tags to Spotlight comments, EagleFiler now separates the tag names with a space instead of a comma-space, and there is an [esoteric preference](#) to set a tag prefix such as `&`.
- When copying files into the library, now copies the Spotlight comments, too.
- Added tooltips to help with setting tag abbreviations in the inspector.

¹⁵⁸<http://codesorcery.net/pukka>

¹⁵⁹<http://nightly.webkit.org>

¹⁶⁰<http://www.barebones.com/products/yojimbo/>

¹⁶¹<http://www.scifihifi.com/cocoalicious/>

¹⁶²<http://www.journler.com>

¹⁶³<http://www.barebones.com/products/yojimbo/>

¹⁶⁴<http://www.happyapps.com/webnotehappy/>

- The [Backup Metadata](#) command can now be used to force EagleFiler to copy the tags to the Spotlight comments, if you don't want to wait for this to happen automatically.
- Added [esoteric preference](#) to make EagleFiler display Web pages using their print stylesheets.
- When [writing a capture script](#), if you obtain the tag names as a single string, you can pass it as `|tagsString|` to let EagleFiler parse it into individual tag names.
- You can now select more than one error at a time in the [Errors](#) window.
- Adjusted the word characters used for indexing to make it easier to find words containing \$, @, %, and _ (This will only take effect after rebuilding the indexes.)
- Made some changes to the [New Library...](#) interface to make it more clear that the maximum library size only applies to encrypted libraries.
- Fixed regression where EagleFiler couldn't open libraries inside folders with non-ASCII names.
- Fixed regression where the **Info** inspector sometimes displayed information for the wrong record(s).
- Fixed bug where `.webloc` files in the **To Import** folder were not deleted after importing.
- If EagleFiler encounters an error while importing a file in a **To Import** folder, it now moves the file to the **Unable to Import** folder so that it won't encounter the same error again the next time it scans the **To Import** folder.
- Fixed bug importing WMA URLs.
- Worked around crash due to bug in Search Kit.
- Fixed bug where the records list lost focus when a search was active and you clicked on a Web archive.
- Fixed bug with the foreground color of highlighted text in the records list.
- Fixed bug where EagleFiler would be slow and could run into an OS error when capturing a large number of documents at once.
- Made various error reporting improvements.
- Improved undo in the inspectors.
- Fixed cosmetic bug with the **Reveal In Library** button.
- Fixed interface glitch where it looked as though EagleFiler would let you move the trash and smart folders around.
- EagleFiler will no longer crash when opening a library on pre-release versions of Mac OS X 10.5.

1.2—May 30, 2007

- Made a variety of changes to improve EagleFiler's speed and responsiveness, especially for libraries with many files.
- You can now copy from one library to another via drag and drop. All of the EagleFiler metadata will be preserved.
- The [New Library...](#) command now offers the option to create an encrypted library.

- Highlights search matches in the items list and the record viewer.
- Each library now has a **To Import** folder in the Finder. Any files that you save into this folder will be imported when you open the library (or within the next minute or two if the library is already open).
- You can now delete (and undelete) individual e-mail messages.
- Uses the available Spotlight importers to index the content of many types of files that EagleFiler doesn't natively understand.
- Added **Match Partial Words** option to the search pop-up. When this is checked, you can search for partial words without having to type wildcards (*) in the query.
- `tag:<tagname>` searches now work with Filename, From, To/Cc, and Title searches, rather than just Anywhere and Notes searches.
- Can now capture from [Skim](#)¹⁶⁵ and [Journler](#)¹⁶⁶ (preserving tags).
- When capturing from [Cocoalicious](#)¹⁶⁷, EagleFiler now preserves the tags and the description and extended description.
- Added **Backup Metadata** command. EagleFiler will automatically backup a library's metadata when it's opened (unless you have Shift held down) and also periodically after it's been opened. You can manually backup the metadata by holding down the Option key and choosing **Backup Metadata** from the **File** menu. Metadata is backed up to `EagleFiler Metadata.plist` files inside the library folder. If you import a file that has backed-up metadata, EagleFiler will use the stored metadata to set the title, from name, checksum, source URL, tags, and notes.
- Added **Copy tags to Spotlight comments** preference. When this is enabled, you'll be able to find files in your library by searching for their tag name using Spotlight.
- If you hold down the Command and Option keys when opening a library, you can access the new **Rebuild Indexes** dialog. This lets you optimize or repair EagleFiler's search indexes, and you can choose whether it indexes for word searches or phrase searches. Previous versions of EagleFiler always indexed for phrase searches. Switching to word indexing will speed up EagleFiler's indexing and substantially reduce the amount of disk space that the indexes consume.
- Added **Update Checksum** command, so that it's easier to tell EagleFiler when you've modified a file using another application.
- When importing via AppleScript, you can now specify which folder to import into, e.g. `import files {theFile} container theFolder`.
- It's now possible to change filenames via AppleScript.
- When using **Previous/Next Record** with the **Info** inspector in front or the tags bar focused, the text field will retain its focus as the selected record changes, making it possible to quickly edit multiple tags/titles/filenames in sequence.
- You can now press Option-Delete when viewing a tag source to move the selected records to the trash rather than unassigning the tag.

¹⁶⁵<http://skim-app.sourceforge.net>

¹⁶⁶<http://www.journler.com>

¹⁶⁷<http://www.scifihifi.com/cocoalicious/>

- Added [Esoteric Preferences](#).
- When exporting messages in `.emlx` format, now includes the tags and notes.
- Now shows a determinat progress bar when importing a folder.
- No longer shows a progress window when opening a library.
- Improved the display of various kinds of multi-part e-mail messages.
- No longer shows the children of smart folders in the source list.
- Now shows the pointing hand cursor when you hover over a clickable link in a text view.
- From the AppleScript interface, it is now possible to access records by name, subject to the filename being unique.
- Added `backup metadata` AppleScript command.
- You can now change the case of a file's extension.
- Updated to Python 2.5.1.
- Worked around OS bug that could cause crash when viewing PDFs.
- Fixed bug where the note tag could get out of sync.
- Fixed bug where creating a link when editing in a rich text view would sometimes insert the link after the selected text.
- Fixed crash when indexing certain QuickTime files.
- Fixed bug calculating checksums of certain document packages.
- Fixed memory leak with Activity Viewer window.
- Worked around Search Kit bug that could cause a crash when doing a phrase search.
- Fixed bug where if you drag-imported multiple folders into a folder, the second and subsequent folders would be imported at the top level.
- Fixed bug capturing from Yojimbo 1.4.2.
- Fixed bug where the URL colorer didn't find certain valid URLs.
- Fixed bug where EagleFiler allowed duplicate files to be added to the library.
- Fixed threading bugs when importing multiple files at once.
- When viewing a Web page, if you click on a link to another part of the same page, EagleFiler now scrolls the window rather than opening the location in a new window.
- Modernized the crash reporter code.
- Fixed bug where EagleFiler would sometimes keep files open after a library had been closed.
- Fixed bug where the **Info** inspector showed “()” for the size of a folder.
- Fixed bug in reporting library save errors.
- Fixed bug where application-level menu commands could get permanently disabled.

1.1.6—March 5, 2007

- Now supports searching by filename.

- Can now capture from [Flock](#)¹⁶⁸.
- The interface is a bit more responsive, due to threading improvements when importing, indexing, and merging.
- No longer hangs when indexing a movie with unresolved file references.
- No longer uses any CPU time when idle.
- Can now import malformed mbox files generated by MailSteward.
- Fixed bug where fields in the inspector could lose their focus when a background operation completed.
- Fixed bug dropping onto an item inside the Trash source.
- Fixed regression displaying contents of multiple folder sources.
- Fixed regression where new rich text records weren't auto-selected.
- Improved error handling during menu/toolbar validation.

1.1.5—February 20, 2007

- Worked around a Cocoa bug that could cause a crash when closing a window or open/save panel.
- The Date column is now called Date Modified.
- Fixed bug where a record's cached modified date could get stale.
- Fixed bug where closing a window or pulling down the File menu could be slow if there were messages selected.
- Fixed regression where the same mailbox could be indexed by duplicate threads.
- Fixed bug remembering the open libraries when quitting.
- Fixed display of library names containing slashes.

1.1.4—February 16, 2007

- Added [Show ▾ Messages in Records Source](#) option. This makes it possible to view and search everything in the library by selecting the **Records** source. Previously, to search e-mail messages you had to select one or more mailboxes; you can still do that, if you want to restrict the search to just those mailboxes.
- The Tags inspector now sorts the assigned tags to the top.
- Added Bigger/Smaller commands for adjusting the text size for rich text documents and Web archives.
- You can now omit the Shift key when pressing the keyboard shortcut to zoom in, i.e. Command-= is now equivalent to Command-+.
- Improved URL coloring in messages.
- Made various performance improvements, particularly to file indexing, display in the browser window, and emptying the trash.

¹⁶⁸<http://www.flock.com>

- Now shows custom file icons (rather than a generic text icon) for files such as OmniGraffle documents that are in XML format but are not strictly text documents.
- Added New Folder button to the [Export...](#) dialog.
- The [Import Files...](#) and [Export...](#) dialogs are now sheets.
- Worked around Search Kit bug that caused crashes when doing phrase searches.
- Worked around suspected Cocoa bug that could cause a crash if you pressed Cancel when creating or opening a library.
- Worked around Cocoa bug that could cause the source list not to properly scroll to show a new tag that had been created.
- Fixed bug importing MailTags projects.
- Fixed bug where the tags field in the Info inspector didn't wrap when there were a lot of tags, or update when the record selection changed.
- Fixed bug where insertion point didn't advance when pressing Space while editing a tag's name in the Tags inspector.
- Fixed bug accessing tags via AppleScript.
- Fixed bug displaying Web archives.
- Fixed problem displaying messages in tag sources if an index file had been damaged.
- Improved compatibility with pre-release versions of Mac OS X 10.5.
- The Software Update auto-updater is now compatible with FileVault.
- No longer shows inaccurate size for folders.
- Made various improvements to the error reporting and error logging.

1.1.3—January 25, 2007

- Can now capture from [DEVONagent](#)¹⁶⁹, [DEVONthink Pro](#)¹⁷⁰ (preserving comments), [Nisus Writer Express](#)¹⁷¹, and [Yojimbo](#)¹⁷² (preserving comments and tags).
- Added [Copy Source URL](#) to the contextual menu.
- Better display of e-mail messages with embedded messages (such as digests and bounced messages).
- You can now use just plain Tab instead of Control-Tab to tab out of the viewer pane in the browser window when the viewer is a read-only text view.
- In the records list, you can now type Option-Enter to edit the title of the selected record.
- If a message attachment doesn't have a name, EagleFiler will list the content subtype next to the paperclip instead of omitting that attachment.
- When capturing from Apple Mail with both messages and mailboxes selected, "Mailboxes" is now the default choice.

¹⁶⁹<http://www.devon-technologies.com/products/devonagent/index.html>

¹⁷⁰<http://www.devon-technologies.com/products/devonthink/index.html>

¹⁷¹<http://www.nisus.com/Express/>

¹⁷²<http://www.barebones.com/products/yojimbo/>

- Better error messages when you try to capture a smart mailbox in Apple Mail.
- EagleFiler cannot import mailboxes from Apple Mail on Mac OS X 10.3 and earlier. Rather than importing the mailboxes as folders, it now reports an error.
- Can now import more types of text clippings.
- Spaces in tag names are now converted to underscores instead of being deleted.
- Fixed error when pressing Enter in the records list.
- Fixed bug where capturing packages from the Finder didn't work.
- Fixed bug where the scroll position and selection in the notes editor would be messed up when switching to another application.
- Worked around a Web Kit bug that caused it to needlessly fetch archived portions of a Web page over the network, or not display them at all if you were offline.
- Worked around a Web Kit bug when displaying a Web archive created from a local HTML file.
- Fixed bug where Reveal In Library sometimes looked in the wrong library.
- Fixed error undoing in the tags fields.
- Fixed error using the Highlight command with no selection.
- EagleFiler's helper tools don't use the URL cache, so now they tell Web Kit not to store one.

1.1.2—January 9, 2007

- Tabbing between the source list, records list, and viewer works much better, as EagleFiler now overrides the Cocoa keyboard loop.
- You can now press Enter in the records list to edit the filename or press Return to open the selected records.
- Can now capture from [PDFView](http://pdfview.sourceforge.net)¹⁷³.
- AppleScript enhancements:
 - Added `import text` command, which takes a string and creates a new rich text file in the library.
 - You can now access the open `browser windows` along with their `displayed records` and `selected records`.
 - Added `note file` and `trashed` properties to `library record`. Also, various formerly read-only `library record` properties are now writable.
 - Added `container` property to `tag`.
- If you click the + button in the browser window with the Tags folder or a tag selected, EagleFiler will create a new tag instead of a new folder.
- EagleFiler is more responsive when emptying the trash, as the lengthy index updating now takes place in a background thread. Also, EagleFiler now compacts the search index when emptying the trash, which should reduce the disk space used and speed up future searches.

¹⁷³<http://pdfview.sourceforge.net>

- Added a hidden preference to make EagleFiler not check for duplicate files during importing. Click the link to [allow duplicate files](#) or to [forbid them](#).
- Worked around PDF kit bug that could cause repeated zooming out when viewing a PDF.
- Fixed bug where EagleFiler didn't recognize document packages when importing a folder full of files.
- Fixed regression where EagleFiler could freeze when clicking an X button in the Activity Viewer.
- If the library changes while you're in the middle of editing a table cell or text field, EagleFiler will no longer replace your in-progress changes with the value from the database, nor will it mess up the insertion point.
- When following an EagleFiler link, if the specified library can't be found, but one with the same name is already open, EagleFiler will try to use that library to open the link.
- Made various changes to improve the responsiveness of the interface.
- Faster file deletions, with better threading, should improve the performance of all background operations that create temporary files.
- Fixed crash when logging indexing errors.
- Worked around some framework bugs that could cause a variety of different crashes.
- The indexer recovers better when a file is unexpectedly deleted.
- Worked around Cocoa bug that could cause some tags to be removed if you ended editing in a tags field by pressing Return when the insertion point wasn't at the end of the field.
- Fixed regression where changes to the tags weren't saved when closing the Info inspector.
- Text filenames are now allowed to have no text before the extension, so you can now store and rename "dotfiles" in EagleFiler.
- It is now possible to edit the extensions of text files.
- If you launch EagleFiler by dropping a file onto it, it will now open the default library before importing the file rather than complaining that no library is open.
- Added blank line before the source URL in the records list tooltip.
- No longer brings the Errors window to the front (which was undesirable if you were in the middle of typing something) when an error occurs—instead, it just makes sure the window is visible.
- The mailbox importer now handles messages that start with ">From " instead of a header.
- Better handling of encrypted PDFs.
- Better error reporting in Endo capture script.
- Better error message when can't capture from Mail.
- Fixed bug logging errors during mailbox rebuild jobs.
- Fixed bug where browser windows didn't remember whether the trash source was expanded between launches.

- Fixed bug where Command-Right Arrow and Command-Left Arrow didn't work in text views.
- Fixed bug where Reveal In Library didn't work for records that were in the trash.
- Simplified the Purchase window.

1.1.1—December 18, 2006

- When capturing a selection of files from the Finder, Spotlight comments may now be imported as tags or notes.
- Can now capture from Microsoft Excel.
- The keyboard shortcut for Import Text is now Command-% instead of Command-<, as the latter conflicted with a system-wide shortcut when using certain keyboard layouts.
- When creating a rich text record using text dragged from Safari (or, generally, any WebView), EagleFiler will now set the source URL and add it to the bottom of the text.
- You can now create records by dragging text selections from within EagleFiler to its source list or records list.
- After you choose [Convert For Editing](#), EagleFiler will now select the newly created RTFD files rather than leaving the original Web archives selected.
- When pasting the results of [Copy Source URL](#) into a rich text view, the clickable text is now the URL itself, rather than the title, and no trailing newline is added.
- Added source URL to tooltip in records list.
- Generates better titles from dragged text.
- If you change the PDF view away from Zoom To Fit, it now remembers the current scale factor.
- Improved the speed of the initial index check when opening the library.
- Improved parsing of mbox files.
- Fixed bug where capturing some URLs didn't work.
- Fixed bug where, when opening a new window to display a record, the record wasn't always selected.
- Fixed bug where EagleFiler could hang if you tried to edit the title or filename of a record while it was doing something else.
- Fixed regression where importing via drag and drop from another application sometimes didn't work.
- Fixed bug and reduced RAM usage when importing a large number of files/folders at once.
- Fixed bug where the source list or records list would go into edit mode when you clicked on it and it didn't already have focus.
- Fixed bug where a PDF or Web archive would needlessly be scrolled to the first page.
- Stopping indexing operations by clicking the X button works better now.
- Indexing no longer hangs if there's a problem loading a Web archive or if it's corrupt.

- Worked around OS bug that prevented some Word documents from being indexed.
- Fixed bug reporting errors while adding a file to the library.
- Better error reporting for damaged Web archive files.
- Fixed bug where tag sources showed messages for mailboxes that were in the trash.
- Fixed bug where child tags weren't sorted in the source list.
- EagleFiler no longer lets you give a tag an empty name.
- Worked around issue when saving libraries on Leopard.
- Worked around OS issue that caused EagleFiler to be the default opener for Word files.
- Worked around some bugs in libraries that EagleFiler uses, which caused errors when importing text via drag and drop.
- Better error reporting when can't write a temporary file or save the library.
- The contextual menu now says Delete instead of Move To Trash, since deleting from a tag source doesn't move to the trash.

1.1—December 6, 2006

Importing

- EagleFiler will now let you **import** any kind of document. If it doesn't know how to display the document, it will simply show the file's icon, which you can click to open it in another application.
- When importing via drag and drop, you can now drop onto folders or tags in the **source list** or into the **records list** in order to put the imported records into that folder or assign them that tag.
- Now recognizes many more kinds of text files and text clippings.
- Can now import individual messages from Entourage via drag and drop.
- Added Command-< keyboard shortcut for the **Import Text** service.
- You can now import by control-clicking on a file in the Finder and choosing **Open With ▸ EagleFiler**.
- Added **Import Clipboard** command to the Dock menu.
- It is now possible to specify tag names and note text when importing via AppleScript.

Capture

- Can now capture IMAP mailboxes and individual selected messages from Apple Mail.
- Can now capture from **Endo**¹⁷⁴, **Firefox**¹⁷⁵, and **WebnoteHappy**¹⁷⁶.
- If you press the capture key when there is no library open or while in an unsupported application, EagleFiler will now try to help you open a library or import the data in another way.
- Capture scripts can now import tags and notes.

¹⁷⁴<http://kula.jp/software/endo/>

¹⁷⁵<http://www.mozilla.com/en-US/firefox/>

¹⁷⁶<http://www.happyapps.com/webnotehappy/>

Text and Rich Text Files

- It's now possible to edit text, RTF, and RTFD files directly in the [record viewer](#). EagleFiler will automatically save any changes that you make and update the files' checksums.
- Creating new rich text files is much smoother. The keyboard shortcut is now Command-N instead of Command-Control-N. If the **File** column is visible, EagleFiler will bypass the sheet, select the new file in the records list, and bring the **File** cell into edit mode so that you can set the filename and title. You can then tab into the [record viewer](#) to begin typing the contents of the file.
- You can drag records into the record viewer (or the notes text view) to create links to them.

Searching

- You can now search by tag. You can also add tag criteria when doing an Anywhere or Notes search (e.g. `tag:apple steve`).
- Now remembers the last-used search scope (globally and per-window).
- You can now access the search syntax help page from the toolbar search field menu.

Tags

- Added auto-completion when typing tag names.
- Added tags field to the bottom of the browser window, so that you can edit the tags of the selected record without having to open another window. You can quickly give the tags field keyboard focus by pressing Command-Shift-T.
- Tag sources now show all the e-mails with that tag (rather than just the files).
- Tag sources now behave more like iTunes playlists and iPhoto albums. If you delete a record from a tag source, EagleFiler unassigns the tag, but the record remains in the library.
- You can now arrange tags into a hierarchy in the source list, to organize them or to hide the ones you don't want to see at the moment.
- Added [New Tag](#) menu command. If records are selected it changes to **New Tag From Selection** and the selected records are assigned the new tag.

Browser Windows

- You can now single-click to edit the Title, From, or File directly, instead of having to open the Inspector window.
- Added [Convert For Editing](#) command, which lets you convert Web archives to RTFD files that can be edited.
- If you hold down Option when double-clicking a Web archive (or a RTFD file converted from a Web archive), EagleFiler opens the current version of the page rather than the archive.
- EagleFiler now shows custom icons for folders. You can set a custom icon using the Finder's Get Info window.
- Added [Show ▸ Source List](#) and [Show ▸ Record Viewer](#) commands for people who want to use the menu or keyboard instead of double-clicking the divider.

- Added **Actual Size** and **Zoom to Fit** commands. The PDF viewer now remembers its zoom state, so that it won't keep resetting to **Zoom to Fit** if you've zoomed in.
- Remembers the selected sources between launches.
- Arrow-keying through the records list is faster now.

Libraries

- Added [Remember open libraries between launches](#) preference and **Startup Items** folder.
- The Drop Pad now has commands for creating a new library, opening a library, and opening recent libraries.
- The Dock menu now shows recent libraries.

Other Enhancements

- If you ask EagleFiler to import a URL and the URL can't be saved as a Web archive (e.g. because it's an image or PDF), EagleFiler will download the file and import it as-is, rather than reporting an error about not being able to save a Web archive.
- Now imports [MailTags](#)¹⁷⁷ projects as tags.
- The **Zoom In** and **Zoom Out** commands now work with Web archives, where they change the font size.
- The **Copy URL** command is now called [Copy Record Link](#).
- Added **Highlight** command, which changes the background of the selected text to yellow.
- Added **Outline** and **Styles...** to the **Format** menu.
- Dragging a library file onto the Drop Pad now opens the library rather than complaining that the library can't be imported.
- Improved the way EagleFiler auto-generates file names when creating a file from dragged text or a Web page's title.
- Now skips importing Apple Mail messages that are marked as deleted.
- Capture scripts are now allowed to use the compiled script format, with the `.scpt` extension.
- Folders and mailboxes no longer have a title attribute that's separate from the file name.
- When creating a new rich text file inside a sub-folder, it's now revealed there instead of in the **Records** source.
- Indexing is now somewhat faster and uses less memory.
- Double-clicking a folder now opens it in EagleFiler instead of in the Finder.
- In the source list, single-clicking now enters edit mode and double-clicking now opens the source.
- Improved secondary sorting of records list.
- Increased maximum width of the Kind column.
- Added keyboard shortcuts for **Select Source** and **Hide Others**.

¹⁷⁷<http://www.indev.ca/MailTags.html>

- Rich text copied using [Copy Record Link](#) now includes the title of the record, rather than just the URL.
- Now displays the proper background color for RTF documents.
- Added [Open Source URL](#), [Copy Record Link](#), and [Verify](#) to the contextual menu.
- The underscore and hyphen characters are now allowed in tag names.
- You can now drag into the records list of a tag source to assign that tag.
- Shortened toolbar button labels.
- The menu commands for **Show Inspector** and [Show Tags](#) now toggle the visibility of the windows rather than showing them.
- The [Software Update...](#) checker now works behind an HTTP proxy.
- The Import Files menu command no longer allows you to import individual files inside an Apple Mail mailbox, as this is usually an error.
- Moved **Open in External Viewer** command to the **Record** menu.
- Added keyboard shortcut for **Open Source URL**.
- Reordered **Record** menu.
- Reduced number of threads used on single-core Macs.
- You can now delete tags from the source list.

Bug Fixes

- Periods in the names of folders are now treated as part of the name, rather than as the beginning of a path extension.
- Worked around OS bug that prevented phrase searching from working. Because of this, EagleFiler will automatically rebuild the indexes of any opened libraries.
- Fixed bug that could cause a crash when importing large folder hierarchies.
- When importing a folder, EagleFiler will now ignore any invisible Find By Content index files.
- Fixed bug importing and moving files with very long names.
- Fixed bug in `.emlx` exporter.
- Fixed bug where EagleFiler couldn't import a Web page if WebKit crashed while trying to extract its text.
- Fixed bug with using **Capture** command in Dock menu.
- Fixed bug where EagleFiler didn't let you capture if you launched it by opening a library from the Finder and then switched to another application so that it finished launching in the background.
- The capture key is now ignored if EagleFiler is frontmost.
- Fixed spelling and resizing of "Title" label in the **New Rich Text File** sheet.
- Fixed crash that could occur when indexing.
- Fixed bug where an indexing operation could stall indefinitely.
- If a document or message can't be indexed, EagleFiler is better at continuing on and indexing the rest of the documents or messages.
- Better logging of index problems.
- Fixed bug where indexed searching didn't work in tag sources.

- Fixed bug where undo didn't work after renaming in source list.
- Fixed bug where the user could use drag and drop to change the page that the Web view was displaying to one other than that of the selected Web archive.
- Better display of messages with no text parts.
- Fixed bug where the Recent smart folders didn't show records that were inside folders.
- Fixed bug where Web archives couldn't be displayed, depending on if you had certain preferences set in Safari.
- Fixed bug where the selection in the notes text view would be needlessly reset when the library changed.
- Fixed bug that could lead to error when undoing too far in the notes text view.
- No longer allows you to give a file an empty name (before the extension), as this confuses Cocoa.
- Fixed bug where the **Show Inspector** command opened the inspector but didn't give it keyboard focus.
- Worked around OS bug that could cause crash when using NetNewsWire Lite.
- Fixed a few bugs that made it impossible to launch EagleFiler from a path containing non-ASCII characters.
- Fixed small memory leak when processing errors.
- Fixed bug where you couldn't create a new folder with / in the name.
- Fixed bug where showed : instead of / when displaying file names.
- The file system encoding is no longer hard-coded to UTF-8.
- Improved thread-safety of record properties.
- When launching, no longer prints "CMSCreateDataProviderOrGetInfo : Invalid colorspace type" message to console.
- Fixed bug where changes to a file's name or title weren't always propagated to the index.
- Fixed bug where source URLs weren't being cached properly.
- Fixed bug opening aliases of libraries.
- Fixed bug where you couldn't create or open a library if its path contained non-ASCII characters.
- Worked around bug in SOHO Notes (and other applications) that prevented drag-and-drop importing of promised files from working.
- Fixed bug importing notes from [MailTags](#)¹⁷⁸.
- Fixed bug where the drag image for a selected source used white text.
- Fixed bug where displaying an HTML e-mail message would take too long to time-out.
- Fixed bug in reporting HTML rendering errors.
- Fixed internal error when closing a library right after opening it.
- Improved error recovery when an untrusted server certificate is encountered while creating a Web archive.

¹⁷⁸<http://www.indev.ca/MailTags.html>

1.0.2—October 14, 2006

- Fixed bug capturing from Apple Mail.

1.0.1—October 14, 2006

- Fixed problem where EagleFiler would sometimes crash at launch if an input manager or haxie was installed.
- Worked around OS bug that caused jitter in the software update progress bar.
- The software update installer no longer says it failed if it succeeded.

1.0—October 13, 2006

- First public release.
